Arithmetic and representation theory of wild character varieties

Received May 18, 2016 and in revised form March 17, 2017

Abstract. We count points over a finite field on wild character varieties of Riemann surfaces for singularities with regular semisimple leading term. A new feature in our counting formulas is the appearance of characters of Yokonuma–Hecke algebras. Our result leads to the conjecture that the mixed Hodge polynomials of these character varieties agree with the previously conjectured perverse Hodge polynomials of certain twisted parabolic Higgs moduli spaces, indicating the possibility of a $P = W$ conjecture for a suitable wild Hitchin system.

Keywords. Irregular connection, character variety, Hitchin system, Yokonuma–Hecke algebra, Macdonald polynomials

0.1. A conjecture

Let C be a complex smooth projective curve of genus $g \in \mathbb{Z}_{\geq 0}$, with divisor

$$D = p_1 + \cdots + p_k + rp$$

where $p_1, \dots, p_k, p \in C$ are distinct points, p having multiplicity $r \in \mathbb{Z}_{\geq 0}$ with $k \geq 0$ and $k + r \geq 1$. For $n \in \mathbb{Z}_{\geq 0}$, let \mathcal{P}_n denote the set of partitions of n and set $\mathcal{P} := \bigcup_n \mathcal{P}_n$. Let $\mu = (\mu^1, \dots, \mu^k) \in \overline{\mathcal{P}}_n^k$ denote a k -tuple of partitions of n , and we write $|\mu| := n$. We denote by $\mathcal{M}_{\text{Dol}}^{\mu, r}$ the moduli space of stable parabolic Higgs bundles (E, ϕ) with quasi-parabolic structure of type μ^i at the pole p_i , with generic parabolic weights and fixed parabolic degree, and a twisted (meromorphic) Higgs field

$$\phi \in H^0(C; \text{End}(E) \otimes K_C(D))$$

with nilpotent residues compatible with the quasi-parabolic structure at the poles p_i (but no restriction on the residue at p). Then $\mathcal{M}_{\text{Dol}}^{\mu, r}$ is a smooth quasi-projective variety of dimension $d_{\mu, r}$ with a proper Hitchin map

$$\chi^{\mu, r} : \mathcal{M}_{\text{Dol}}^{\mu, r} \rightarrow \mathcal{A}^{\mu, r}$$

defined by taking the characteristic polynomial of the Higgs field ϕ and thus taking values in the Hitchin base

$$\mathcal{A}^{\mu,r} := \bigoplus_{i=1}^n H^0(C; K_C(D)^i).$$

As $\chi^{\mu,r}$ is proper it induces as in [dCM] a perverse filtration P on the rational cohomology $H^*(\mathcal{M}_{\text{Dol}}^{\mu,r})$ of the total space. We define the perverse Hodge polynomial as

$$PH(\mathcal{M}_{\text{Dol}}^{\mu,r}; q, t) := \sum \dim(\text{Gr}_i^P H^k(\mathcal{M}_{\text{Dol}}^{\mu,r})) q^i t^k.$$

The recent paper [CDDP] by Chuang–Diaconescu–Donagi–Pantev gives a string-theoretical derivation of the following mathematical conjecture.

Conjecture 0.1.1. *We expect*

$$PH(\mathcal{M}_{\text{Dol}}^{\mu,r}; q, t) = (qt^2)^{d_{\mu,r}} \mathbb{H}_{\mu,r}(q^{1/2}, -q^{-1/2}t^{-1}).$$

Here, $\mathbb{H}_{\mu,r}(z, w) \in \mathbb{Q}(z, w)$ is defined by the generating function formula

$$\begin{aligned} \sum_{\mu \in \mathcal{P}^k} \frac{(-1)^{r|\mu|} w^{-d_{\mu,r}} \mathbb{H}_{\mu,r}(z, w)}{(z^2 - 1)(1 - w^2)} \prod_{i=1}^k m_{\mu_i}(x_i) \\ = \text{Log} \left(\sum_{\lambda \in \mathcal{P}} \mathcal{H}_{\lambda}^{g,r}(z, w) \prod_{i=1}^k \tilde{H}_{\lambda}(z^2, w^2; x_i) \right). \end{aligned} \tag{0.1.2}$$

The notation is explained as follows. For a partition $\lambda \in \mathcal{P}$ we denote

$$\mathcal{H}_{\lambda}^{g,r}(z, w) = \prod \frac{(-z^{2a} w^{2l})^r (z^{2a+1} - w^{2l+1})^{2g}}{(z^{2a+2} - w^{2l})(z^{2a} - w^{2l+2})}, \tag{0.1.3}$$

where the product is over the boxes in the Young diagram of λ and a and l are the arm length and the leg length of the given box. We denote by $m_{\lambda}(x_i)$ the monomial symmetric functions in the infinitely many variables $x_i := (x_{i_1}, x_{i_2}, \dots)$ attached to the puncture p_i . $\tilde{H}_{\lambda}(q, t; x_i)$ denotes the twisted Macdonald polynomials of Garsia–Haiman [GH], which is a symmetric function in the variables x_i with coefficients from $\mathbb{Q}(q, t)$. Finally, Log is the plethystic logarithm (see e.g. [HLV1, §2.3.3] for a definition).

The paper [CDDP] gives several pieces of evidence for Conjecture 0.1.1. On physical grounds it argues that the left hand side should be the generating function for certain refined BPS invariants of some associated Calabi–Yau 3-orbifold Y , which the authors then relate by a refined Gopakumar–Vafa conjecture to the generating function of the refined Pandharipande–Thomas invariants of Y . In turn they can compute the latter in some cases using the recent approach of Nekrasov–Okounkov [NO], finding agreement with Conjecture 0.1.1. Another approach is to use another duality conjecture—the so-called “geometric engineering”—which conjecturally relates the left hand side of Conjecture 0.1.1 to generating functions for equivariant indices of some bundles on certain nested Hilbert schemes of points on the affine plane \mathbb{C}^2 . They compute this using work of Haiman [Hai] and find agreement with the right hand side of Conjecture 0.1.1.

Purely mathematical evidence for Conjecture 0.1.1 comes through a parabolic version of the $P = W$ conjecture of [dCHM], in the case when $r = 0$. In this case, by non-abelian Hodge theory we expect the parabolic Higgs moduli space $\mathcal{M}_{\text{Dol}}^\mu := \mathcal{M}_{\text{Dol}}^{\mu,0}$ to be diffeomorphic to a certain character variety \mathcal{M}_B^μ , which we will define more carefully below. The cohomology of \mathcal{M}_B^μ carries a weight filtration, and we denote by

$$WH(\mathcal{M}_B^\mu; q, t) := \sum_{i,k} \dim(\text{Gr}_{2i}^W H^k(\mathcal{M}_B^\mu)) q^i t^k$$

the mixed Hodge polynomial of \mathcal{M}_B^μ . The $P = W$ conjecture predicts that the perverse filtration P on $H^*(\mathcal{M}_{\text{Dol}}^\mu)$ is identified with the weight filtration W on $H^*(\mathcal{M}_B^\mu)$ via non-abelian Hodge theory. In particular, $P = W$ would imply $PH(\mathcal{M}_{\text{Dol}}^\mu; q, t) = WH(\mathcal{M}_B^\mu; q, t)$, and Conjecture 0.1.1 for $r = 0$; $PH(\mathcal{M}_{\text{Dol}}^\mu; q, t)$ replaced with $WH(\mathcal{M}_B^\mu; q, t)$ was the main conjecture in [HLV1].

It is interesting to recall what inspired Conjecture 0.1.1 for $r > 0$. Already in [HV, Section 5], detailed knowledge of the cohomology ring $H^*(\mathcal{M}_{\text{Dol}}^{(2),r})$ from [HT] was needed for the computation of $WH(\mathcal{M}_B^{(2)}; q, t)$. In fact, it was observed in [dCHM] that the computation in [HV, Remark 2.5.3] amounted to a formula for $PH(\mathcal{M}_{\text{Dol}}^\mu; q, t)$, which is the first non-trivial instance of Conjecture 0.1.1. This twist by r was first extended for the conjectured $PH(\mathcal{M}_{\text{Dol}}^{(n),r})$ in [Mo] to match the recursion relation in [CDP]; it was then generalized in [CDDP] to Conjecture 0.1.1. We notice that the twisting by r only slightly changes the definition of $\mathcal{H}^{g,r}(z, w)$ above and the rest of the right hand side of Conjecture 0.1.1 does not depend on r .

It was also speculated in [HV, Remark 2.5.3] that there is a character variety whose mixed Hodge polynomial would agree with the one conjectured for $PH(\mathcal{M}_{\text{Dol}}^{\mu,r}; q, t)$ above.

Problem 0.1.4. *Is there a character variety whose mixed Hodge polynomial agrees with $PH(\mathcal{M}_{\text{Dol}}^{\mu,r}; q, t)$?*

A natural idea to answer this question is to look at the symplectic leaves of the natural Poisson structure on $\mathcal{M}_{\text{Dol}}^{\mu,r}$. The symplectic leaves should correspond to moduli spaces of irregular or wild Higgs moduli spaces. By the wild non-abelian Hodge theorem [BB] those will be diffeomorphic to wild character varieties.

0.2. Main result

In this paper we will study a class of wild character varieties which will conjecturally provide a partial answer to the problem above. Namely, we will look at wild character varieties allowing irregular singularities with polar part having a diagonal regular leading term. Boalch [B3] gives the following construction.

Let $G := \text{GL}_n(\mathbb{C})$ and let $T \leq G$ be the maximal torus of diagonal matrices. Let $B_+ \leq G$ (resp. $B_- \leq G$) be the Borel subgroup of upper (resp. lower) triangular matrices. Let $U = U_+ \leq B_+$ (resp. $U_- \leq B_-$) be the respective unipotent radicals, i.e., the group

of upper (resp. lower) triangular matrices with 1s on the main diagonal. We fix $m \in \mathbb{Z}_{\geq 0}$ and

$$\mathbf{r} := (r_1, \dots, r_m) \in \mathbb{Z}_{>0}^m.$$

For $\boldsymbol{\mu} \in \mathcal{P}_n^k$ we also fix a k -tuple $(\mathcal{C}_1, \dots, \mathcal{C}_k)$ of semisimple conjugacy classes such that the class $\mathcal{C}_i \subset \mathbf{G}$ is of the type

$$\mu^i = (\mu_1^i, \mu_2^i, \dots) \in \mathcal{P}_n;$$

in other words, \mathcal{C}_i has eigenvalues with multiplicities μ_j^i . Finally, we fix

$$(\xi_1, \dots, \xi_m) \in (\mathbf{T}^{\text{reg}})^m,$$

an m -tuple of regular diagonal matrices, such that the $k + m$ -tuple

$$(\mathcal{C}_1, \dots, \mathcal{C}_k, \mathbf{G}\xi_1, \dots, \mathbf{G}\xi_m)$$

of semisimple conjugacy classes is generic in the sense of Definition 1.2.9. Then define

$$\begin{aligned} \mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}, \mathbf{r}} := & \{(A_i, B_i)_{i=1}^n \in (\mathbf{G} \times \mathbf{G})^g, X_j \in \mathcal{C}_j, C_j \in \mathbf{G}, (S_{2i-1}^j, S_{2i}^j)_{i=1}^{r_j} \in (\mathbf{U}_- \times \mathbf{U}_+)^{r_j} \mid \\ & (A_1, B_1) \cdots (A_g, B_g) X_1 \cdots X_k C_1^{-1} \xi_1 S_{2r_1}^1 \cdots S_1^1 C_1 \cdots C_m^{-1} \xi_m S_{2r_m}^m \cdots S_1^m C_m = I_n\} // \mathbf{G}, \end{aligned}$$

where the affine quotient is by the conjugation action of \mathbf{G} on the matrices A_i, B_i, X_i, C_i and the trivial action on S_i^j . Under the genericity condition as above, $\mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}, \mathbf{r}}$ is a smooth affine variety of dimension $d_{\boldsymbol{\mu}, \mathbf{r}}$ given by (1.2.14). In particular, when $m = 0$, we have the character varieties $\mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}} = \mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}, \emptyset}$ of [HLV1, Conjecture 0.2.1].

The main result of this paper is the following:

Theorem 0.2.1. *Let $\boldsymbol{\mu} \in \mathcal{P}_n^k$ be a k -tuple of partitions of n and \mathbf{r} be an m -tuple of positive integers, and let $\mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}, \mathbf{r}}$ be the generic wild character variety as defined above. Then*

$$WH(\mathcal{M}_{\mathbf{B}}^{\boldsymbol{\mu}, \mathbf{r}}; q, -1) = q^{d_{\boldsymbol{\mu}, \mathbf{r}}} \mathbb{H}_{\tilde{\boldsymbol{\mu}}, r}(q^{1/2}, q^{-1/2}),$$

where

$$\tilde{\boldsymbol{\mu}} := (\mu^1, \dots, \mu^k, (1^n), \dots, (1^n)) \in \mathcal{P}_n^{k+m}$$

is the type of

$$(\mathcal{C}_1, \dots, \mathcal{C}_k, \mathbf{G}\xi_1, \dots, \mathbf{G}\xi_m)$$

and

$$r := r_1 + \cdots + r_m.$$

The proof of this result follows the route introduced in [HV, HLV1, HLV2]. Using a theorem of Katz [HV, Appendix], it reduces the problem of the computation of $WH(\mathcal{M}_B^{\mu,r}; q, -1)$ to counting $\mathcal{M}_B^{\mu,r}(\mathbb{F}_q)$, i.e., the \mathbb{F}_q -points of $\mathcal{M}_B^{\mu,r}$. We count them by using a non-abelian Fourier transform. The novelty here is the determination of the contribution of the wild singularities to the character sum.

The latter problem is solved via the character theory of the Yokonuma–Hecke algebra, which is the convolution algebra on

$$\mathbb{C}[U(\mathbb{F}_q)\backslash GL_n(\mathbb{F}_q)/U(\mathbb{F}_q)],$$

where U is as above. The main computational result, Theorem 3.3.4, is an analogue of a theorem of Springer (cf. [GP, Theorem 9.2.2]) which gives an explicit value for the trace of a certain central element of the Hecke algebra in a given representation.

This theorem, in turn, rests on a somewhat technical result relating the classification of the irreducible characters of the group $N = (\mathbb{F}_q^\times)^n \rtimes \mathfrak{S}_n$ to that of certain irreducible characters of $GL_n(\mathbb{F}_q)$. To explain it briefly, if \mathcal{Q}_n denotes the set of maps from $\Gamma_1 = \widehat{\mathbb{F}_q^\times}$ (the character group of \mathbb{F}_q^\times) to the set of partitions of total size n (see Section 2.7 for definitions and details), then \mathcal{Q}_n parametrizes both $\text{Irr } N$ and a certain subset of $\text{Irr } GL_n(\mathbb{F}_q)$. Furthermore, both of these sets are in bijection with the irreducible characters of the Yokonuma–Hecke algebra. Theorem 2.9.5 clarifies this relationship, establishing an analogue of a result proved by Halverson and Ram [HR, Theorem 4.9(b)], though by different techniques.

Our main result Theorem 0.2.1 then leads to the following conjecture.

Conjecture 0.2.2. *We have*

$$WH(\mathcal{M}_B^{\mu,r}; q, t) = (qt^2)^{d_{\mu,r}} \mathbb{H}_{\tilde{\mu},r}(q^{1/2}, -q^{-1/2}t^{-1}).$$

This gives a conjectural partial answer to our Problem 0.1.4 originally raised in [HV, Remark 2.5.3]. Namely, in the cases when at least one of the partitions μ^i is (1^n) , we can conjecturally find a character variety whose mixed Hodge polynomial agrees with the mixed Hodge polynomial of a twisted parabolic Higgs moduli space. This class does not yet include the example studied in [HV, Remark 2.5.3], where there is a single trivial partition $\mu = ((n))$. We expect that those cases could be covered by using more complicated, possibly twisted, wild character varieties.

Finally, we note that a recent conjecture [STZ, Conjecture 1.12] predicts that in the case when $g = 0, k = 0, m = 1$ and $r = r_1 \in \mathbb{Z}_{>0}$, the mixed Hodge polynomial of our (and more general) wild character varieties, are intimately related to refined invariants of links arising from Stokes data. Our formulas in this case should be related to refined invariants of the (n, rn) torus links. We hope that the natural emergence of Hecke algebras in the arithmetic of wild character varieties will shed new light on Jones’s approach [Jo] to the HOMFLY polynomials via Markov traces on the usual Iwahori–Hecke algebra and the analogous Markov traces on the Yokonuma–Hecke algebra (cf. [J1, CL, JP]).

The structure of the paper is as follows. Section 1 reviews mixed Hodge structures on the cohomology of algebraic varieties, the theorem of Katz mentioned above, and gives

the precise definition of a wild character variety from [B3]. In Section 2 we recall the abstract approach to Hecke algebras; the explicit character theory of the Iwahori–Hecke and Yokonuma–Hecke algebras is also reviewed and clarified. In Section 3 we recall the arithmetic Fourier transform approach of [HLV1] and perform the count on the wild character varieties. In Section 4 we prove our main Theorem 0.2.1 and discuss our main Conjecture 0.2.2. In Section 5 we compute some specific examples of Theorem 0.2.1 and Conjecture 0.2.2, when $n = 2$, with particular attention paid to the cases when $\mathcal{M}_B^{\mu, \mathbf{r}}$ is a surface.

1. Generalities

1.1. Mixed Hodge polynomials and counting points

To motivate the problem of counting points on an algebraic variety, we remind the reader of some facts concerning mixed Hodge polynomials and varieties with polynomial count, more details of which can be found in [HV, §2.1]. Let X be a complex algebraic variety. The general theory of [D1, D2] provides a mixed Hodge structure on the compactly supported cohomology of X : that is, there is an increasing weight filtration W_\bullet on $H^j(X, \mathbb{Q})$ and a decreasing Hodge filtration F^\bullet on $H^j(X, \mathbb{C})$. The *mixed Hodge numbers* of X are defined as

$$h^{p,q;j}(X) := \dim_{\mathbb{C}} \operatorname{Gr}_F^p \operatorname{Gr}_{p+q}^W H^j(X, \mathbb{C}),$$

the *mixed Hodge polynomial* of X by

$$H(X; x, y, t) := \sum h^{p,q;j}(X) x^p y^q t^j,$$

and, when X is smooth, the *E-polynomial* of X by

$$E(X; x, y) := (xy)^{\dim X} H(X; 1/x, 1/y, -1).$$

We could also define the mixed weight polynomial

$$WH(X; q, t) = \sum \dim_{\mathbb{C}} \operatorname{Gr}_k^W H^j(X, \mathbb{C}) q^{k/2} t^j = H(X; q^{1/2}, q^{1/2}, t)$$

which, for a smooth X , specializes to the weight polynomial

$$E(q) := q^{\dim X} WH(X; 1/q, -1) = E(X; q^{1/2}, q^{1/2}).$$

One observes that the Poincaré polynomial $P(X; t)$ is given by

$$P(X; t) = H(X; 1, 1, t).$$

Suppose that there exists a separated scheme \mathcal{X} over a finitely generated \mathbb{Z} -algebra R , such that for some embedding $R \hookrightarrow \mathbb{C}$ we have

$$\mathcal{X} \times_R \mathbb{C} \cong X;$$

in that case we say that \mathcal{X} is a *spreading out* of X . If, further, there exists a polynomial $P_X(w) \in \mathbb{Z}[w]$ such that for any homomorphism $R \rightarrow \mathbb{F}_q$ (where \mathbb{F}_q is the finite field of q elements), one has

$$|\mathcal{X}(\mathbb{F}_q)| = P_X(q),$$

then we say that X has *polynomial count* and P_X is the *counting polynomial* of X . The motivating result is then the following.

Theorem 1.1.1 (N. Katz, [HV, Theorem 6.1.2]). *Suppose that the complex algebraic variety X is of polynomial count with counting polynomial P_X . Then*

$$E(X; x, y) = P_X(xy).$$

Remark 1.1.2. Thus, in the polynomial count case we find that the count polynomial $P_X(q) = E(X; q)$ agrees with the weight polynomial. We also expect our varieties to be Hodge–Tate, i.e., $h^{p,q;j}(X) = 0$ unless $p = q$, in which case $H(X; x, y, t) = WH(X; xy, t)$. Thus, in these cases we are not losing information by considering $WH(X; xy, t)$ (resp. $E(X; q)$) instead of the usual $H(X; x, y, t)$ (resp. $E(X; x, y)$).

1.2. Wild character varieties

The wild character varieties we study in this paper were first mentioned in [B2, §3, Remark 5], as a then new example in quasi-Hamiltonian geometry—a “multiplicative” variant of the theory of Hamiltonian group actions on symplectic manifolds—with a more thorough (and more general) construction given in [B3, §8]. We give a direct definition here for which knowledge of quasi-Hamiltonian geometry is not required; however, as we appeal to results of [B3, §9] on smoothness and the dimension of the varieties in question, we use some of the notation of [B3, §9] to justify the applicability of those results.

1.2.1. Definition. We now set some notation which will be used throughout. Let $G := \mathrm{GL}_n(\mathbb{C})$ and fix the maximal torus $T \leq G$ consisting of diagonal matrices; let $\mathfrak{g} := \mathfrak{gl}_n(\mathbb{C})$ and $\mathfrak{t} := \mathrm{Lie}(T)$ be the corresponding Lie algebras. Let $B_+ \leq G$ (resp., $B_- \leq G$) be the Borel subgroup of upper (resp., lower) triangular matrices. Let $U = U_+ \leq B_+$ (resp., $U_- \leq B_-$) be the unipotent radical, i.e., the group of upper (resp., lower) triangular matrices with 1s on the main diagonal; note that each of these subgroups is normalized by T .

Definition 1.2.1. For $r \in \mathbb{Z}_{>0}$, we set

$$\mathcal{A}^r := G \times (U_+ \times U_-)^r \times T.$$

An element of \mathcal{A}^r will typically be written (C, S, t) with

$$S = (S_1, \dots, S_{2r}) \in (U_+ \times U_-)^r,$$

where $S_i \in U_+$ if i is odd and $S_i \in U_-$ if i is even. The group T acts on $(U_+ \times U_-)^r$ by

$$x \cdot S = (xS_1x^{-1}, \dots, xS_{2r}x^{-1});$$

the latter tuple will often be written simply as xSx^{-1} .

We fix $g, k, m \in \mathbb{Z}_{\geq 0}$ with $k + m \geq 1$. Fix also a k -tuple

$$\mathcal{C} := (\mathcal{C}_1, \dots, \mathcal{C}_k)$$

of semisimple conjugacy classes $\mathcal{C}_j \subseteq G$; the multiset of multiplicities of the eigenvalues of each \mathcal{C}_j determines a partition $\mu^j \in \mathcal{P}_n$. Hence we obtain a k -tuple

$$\boldsymbol{\mu} := (\mu^1, \dots, \mu^k) \in \mathcal{P}_n^k,$$

which we call the *type* of \mathcal{C} . Fix also

$$\mathbf{r} := (r_1, \dots, r_m) \in \mathbb{Z}_{>0}^m.$$

We will write $r := \sum_{\alpha=1}^m r_\alpha$. Now consider the product

$$\mathcal{R}^{g, \mathcal{C}, \mathbf{r}} := (G \times G)^g \times \mathcal{C}_1 \times \dots \times \mathcal{C}_k \times \mathcal{A}^{r_1} \times \dots \times \mathcal{A}^{r_m}.$$

The affine variety $\mathcal{R}^{g, \mathcal{C}, \mathbf{r}}$ admits an action of $G \times T^m$ given by

$$\begin{aligned} (y, x_1, \dots, x_m) \cdot (A_i, B_i, X_j, C_\alpha, S^\alpha, t_\alpha) \\ = (yA_iy^{-1}, yB_iy^{-1}, yX_jy^{-1}, x_\alpha C_\alpha y^{-1}, x_\alpha S_\alpha x_\alpha^{-1}, t_\alpha) \end{aligned} \quad (1.2.2)$$

where $1 \leq i \leq g, 1 \leq j \leq k$ and $1 \leq \alpha \leq m$.

Now, fixing an element $\boldsymbol{\xi} = (\xi_1, \dots, \xi_m) \in T^m$, we define a closed subvariety of $\mathcal{R}^{g, \mathcal{C}, \mathbf{r}}$ by

$$\begin{aligned} \mathcal{U}^{g, \mathcal{C}, \mathbf{r}, \boldsymbol{\xi}} := \left\{ (A_i, B_i, X_j, C_\alpha, S^\alpha, t_\alpha) \in \mathcal{R}^{g, \mathcal{C}, \mathbf{r}} : \right. \\ \left. \prod_{i=1}^g (A_i, B_i) \prod_{j=1}^k X_j \prod_{\alpha=1}^m C_\alpha^{-1} \xi_\alpha S_{2r_\alpha}^\alpha \cdots S_1^\alpha C_\alpha = I_n, t_\alpha = \xi_\alpha, 1 \leq \alpha \leq m \right\} \end{aligned} \quad (1.2.3)$$

where the product means we write the elements in the order of their indices:

$$\prod_{i=1}^d y_i = y_1 \cdots y_d.$$

It is easy to see that $\mathcal{U}^{g, \mathcal{C}, \mathbf{r}, \boldsymbol{\xi}}$ is invariant under the action of $G \times T^m$. Finally, we define the (*generic*) *genus g wild character variety with parameters $\mathcal{C}, \mathbf{r}, \boldsymbol{\xi}$* as the affine geometric invariant theory quotient

$$\mathcal{M}_B^{g, \mathcal{C}, \mathbf{r}, \boldsymbol{\xi}} := \mathcal{U}^{g, \mathcal{C}, \mathbf{r}, \boldsymbol{\xi}} / (G \times T^m) = \text{Spec } \mathbb{C}[\mathcal{U}^{g, \mathcal{C}, \mathbf{r}, \boldsymbol{\xi}}]^{G \times T^m}. \quad (1.2.4)$$

Since g will generally be fixed and understood, we will typically omit it from the notation. Furthermore, since the invariants we compute depend only on the tuples $\boldsymbol{\mu}$ and \mathbf{r} , rather than the actual conjugacy classes \mathcal{C} and $\boldsymbol{\xi}$, we will usually abbreviate our notation to $\mathcal{M}_B^{\boldsymbol{\mu}, \mathbf{r}}$ and $\mathcal{U}^{\boldsymbol{\mu}, \mathbf{r}}$.

Remark 1.2.5. The space \mathcal{A}^r defined at the beginning of Definition 1.2.1 is a “higher fission space” in the terminology of [B3, §3]. These are spaces of local monodromy data for a connection with a higher order pole. To specify a de Rham space—these are constructed in [BB], along with their Dolbeault counterparts—at each higher order pole, one specifies a “formal type” which is the polar part of an irregular connection which will have diagonal entries under some trivialization; this serves as a “model” connection. The de Rham moduli space then parametrizes holomorphic isomorphism classes of connections which are all formally isomorphic to the specified formal type. Locally these holomorphic isomorphism classes are distinguished by their Stokes data, which live in the factor $(U_+ \times U_-)^r$ appearing in \mathcal{A}^r . The factor of T appearing is the “formal monodromy” which differs from the actual monodromy by the product of the Stokes matrices, as appearing in the last set of factors in the expression (1.2.3). The interested reader is referred to [B1, §2] for details about Stokes data.

Remark 1.2.6. As mentioned above, these wild character varieties were constructed in [B3, §8] as quasi-Hamiltonian quotients. In quasi-Hamiltonian geometry, one speaks of a space with a group action and a moment map into the group. In this case, we had an action on $\mathcal{R}^{\mu,r}$ given in (1.2.2) and the corresponding moment map $\Phi : \mathcal{R}^{\mu,r} \rightarrow G \times T^m$ would be

$$(A_i, B_i, X_j, C_\alpha, S_\alpha, t_\alpha) \mapsto \left(\prod_{i=1}^g [A_i, B_i] \prod_{j=1}^k X_j \prod_{\alpha=1}^m C_\alpha^{-1} t_\alpha S_{2r_\alpha}^\alpha \cdots S_1^\alpha C_\alpha, t_1^{-1}, \dots, t_m^{-1} \right).$$

Then one sees that $\mathcal{U}^{\mu,r} = \Phi^{-1}((I_n, \xi^{-1}))$ and so $\mathcal{M}_B^{\mu,r} = \Phi^{-1}((I_n, \xi^{-1}))/ (G \times T^m)$ is a quasi-Hamiltonian quotient.

Remark 1.2.7. By taking determinants in (1.2.3) we observe that a necessary condition for $\mathcal{U}^{\mu,r}$, and hence $\mathcal{M}_B^{\mu,r}$, to be non-empty is that

$$\prod_{j=1}^k \det C_j \cdot \prod_{\alpha=1}^m \det \xi_\alpha = 1; \tag{1.2.8}$$

note that $\det S_p^\alpha = 1$ for $1 \leq \alpha \leq m$ and $1 \leq p \leq 2r_\alpha$.

1.2.2. *Smoothness and dimension computation.* We recall [HLV1, Definition 2.1.1].

Definition 1.2.9. The k -tuple $\mathcal{C} = (C_1, \dots, C_k)$ is *generic* if the following holds. If $V \subseteq \mathbb{C}^n$ is a subspace stable by some $X_i \in C_i$ for each i such that

$$\prod_{i=1}^k \det(X_i|_V) = 1 \tag{1.2.10}$$

then either $V = 0$ or $V = \mathbb{C}^n$. When additionally $\xi = (\xi_1, \dots, \xi_m) \in T^m$, we say that

$$\mathcal{C} \times \xi = (C_1, \dots, C_k, \xi_1, \dots, \xi_m)$$

is generic if $(C_1, \dots, C_k, G\xi_1, \dots, G\xi_m)$ is, where $G\xi_i$ is the conjugacy class of ξ_i in G .

Remark 1.2.11. It is straightforward to see that the genericity of $(\mathcal{C}_1, \dots, \mathcal{C}_k)$ for a k -tuple of semisimple conjugacy classes can be formulated in terms of the spectra of the matrices in \mathcal{C}_i as follows. Let

$$\mathbf{A}_i := \{\alpha_1^i, \dots, \alpha_n^i\}$$

be the multiset of eigenvalues of a matrix in \mathcal{C}_i for $i = 1 \dots k$. Then $(\mathcal{C}_1, \dots, \mathcal{C}_k)$ is generic if and only if the following non-equalities (1.2.12) hold. Write

$$[\mathbf{A}] := \prod_{\alpha \in \mathbf{A}} a$$

for any multiset $\mathbf{A} \subseteq \mathbf{A}_i$. The non-equalities are

$$[\mathbf{A}'_1] \cdots [\mathbf{A}'_k] \neq 1 \tag{1.2.12}$$

for $\mathbf{A}'_i \subseteq \mathbf{A}_i$ of the same cardinality n' with $0 < n' < n$.

Theorem 1.2.13. *For a generic choice of $\mathcal{C} \times \xi$ (in the sense of Definition 1.2.9), the wild character variety $\mathcal{M}_B^{\mu, \mathbf{r}}$ is smooth. Furthermore, the $G \times T^m$ action on $\mathcal{U}^{\mu, \mathbf{r}}$ is scheme-theoretically free. Finally,*

$$\dim \mathcal{M}_B^{\mu, \mathbf{r}} = (2g + k - 2)n^2 - \|\mu\|^2 + n(n - 1)(m + r) + 2 =: d_{\mu, \mathbf{r}}, \tag{1.2.14}$$

where $r := \sum_{\alpha=1}^m r_\alpha$ and

$$\|\mu\|^2 = \sum_{j=1}^k \sum_{p=1}^{\ell_j} (\mu_p^j)^2 \quad \text{for } \mu^j = (\mu_1^j, \dots, \mu_{\ell_j}^j).$$

The first statement is a special case of [B3, Corollary 9.9], the second follows from the observations following [B3, Lemma 9.10], and the dimension formula comes from [B3, §9, (41)]. To see that our wild character varieties are indeed special cases of those constructed there, one needs to see that the “double” $\mathbf{D} = G \times G$ (see [B3, Example 2.3]) is a special case of a higher fission variety, as noted in [B3, §3, Example (1)], and that $\mathbf{D} //_{\mathcal{C}^{-1}G} \cong \mathcal{C}$ for a conjugacy class $\mathcal{C} \subset G$. Then one may form the space

$$\mathcal{S}^{g, k, \mathbf{r}} := \mathbb{D}^{\otimes Gg} \otimes_G \mathbf{D}^{\otimes Gk} \otimes_G \mathcal{A}^{r_1} \otimes_G \cdots \otimes_G \mathcal{A}^{r_m} // G$$

in the notation of [B3, §§2,3] and see that $\mathcal{M}_B^{\mu, \mathbf{r}}$ is a quasi-Hamiltonian quotient of the above space by the group $G^k \times T^m$ at the conjugacy class $(\mathcal{C} \times \xi)$, and is hence a wild character variety as defined in [B3, p. 342].

To see that the genericity condition given in [B3, §9, (38), (39)] specializes to ours (Definition 1.2.9), we observe that for $G = \text{GL}_n(\mathbb{C})$ the Levi subgroup L of a maximal standard parabolic subgroup P corresponds to a subgroup of matrices consisting of two diagonal blocks, and as indicated earlier in the proof of [B3, Corollary 9.7], the map denoted pr_L takes the determinant of each factor. In particular, it takes the determinant of the relevant matrices restricted to the subspace preserved by P . But this is the condition in Definition 1.2.9.

Finally, using [B3, §9, (41)] and the fact that $\dim U_+ = \dim U_- = \binom{n}{2}$, it is straightforward to compute the dimension as (1.2.14).

2. Hecke algebras

In the following, we describe the theory of Hecke algebras that we will need for our main results. Let us first explain some notation that will be used. Typically, the object under discussion will be a \mathbb{C} -algebra \mathbf{A} which is finite-dimensional over \mathbb{C} . We will denote its set of (isomorphism classes of) representations by $\text{Rep } \mathbf{A}$ and the subset of irreducible representations by $\text{Irr } \mathbf{A}$; since it will often be inconsequential, we will often also freely confuse an irreducible representation with its character. Of course, if $\mathbf{A} = \mathbb{C}[G]$ is the group algebra of a group G , then we often shorten $\text{Irr } \mathbb{C}[G]$ to $\text{Irr } G$. We will also sometimes need to consider “deformations” or “generalizations” of these algebras. If \mathbf{H} is an algebra that is free of finite rank over $\mathbb{C}[u^{\pm 1}]$ then its extension $\mathbb{C}(u) \otimes_{\mathbb{C}[u^{\pm 1}]} \mathbf{H}$ to the quotient field $\mathbb{C}(u)$ of $\mathbb{C}[u^{\pm 1}]$ will be denoted by $\mathbf{H}(u)$. Note that this abbreviates the notation $\mathbb{C}(u)\mathbf{H}$ in [CPA] and [GP, §7.3]. Now, if $z \in \mathbb{C}^\times$ and $\theta_z : \mathbb{C}[u^{\pm 1}] \rightarrow \mathbb{C}$ is the \mathbb{C} -algebra homomorphism which maps $u \mapsto z$, then we may consider the “specialization” $\mathbb{C} \otimes_{\theta_z} \mathbf{H}$ of \mathbf{H} to $u = z$, which we will denote by $\mathbf{H}(z)$.

2.1. Definitions and conventions

Let G be a finite group and $H \leq G$ a subgroup. Given a subset $S \subseteq G$, we will denote its indicator function by $\mathbb{1}_S : G \rightarrow \mathbb{Z}_{\geq 0}$, that is,

$$\mathbb{1}_S(x) = \begin{cases} 1, & x \in S, \\ 0, & \text{otherwise.} \end{cases}$$

Let M be the vector space of functions $f : G \rightarrow \mathbb{C}$ such that

$$f(hg) = f(g)$$

for all $h \in H$ and $g \in G$. Clearly, M can be identified with the space of complex-valued functions on $H \backslash G$ and so has dimension $[G : H]$. We may choose a set V of right H -coset representatives, so that

$$G = \bigsqcup_{v \in V} Hv. \tag{2.1.1}$$

Such a choice gives a basis

$$\{f_v := \mathbb{1}_{Hv}\}_{v \in V} \tag{2.1.2}$$

of M . Furthermore, we have a G -action on M via

$$(g \cdot f)(x) := f(xg). \tag{2.1.3}$$

With this action, M is identified with the induced representation $\text{Ind}_H^G \mathbb{1}_H$ of the trivial representation $\mathbb{1}_H$ on H .

The Hecke algebra associated to G and H , which we denote by $\mathcal{H}(G, H)$, is the vector space of functions $\varphi : G \rightarrow \mathbb{C}$ such that

$$\varphi(h_1 g h_2) = \varphi(g)$$

for $h_1, h_2 \in H$ and $g \in G$. It has the following convolution product:

$$(\varphi_1 * \varphi_2)(g) := \frac{1}{|H|} \sum_{a \in G} \varphi_1(g a^{-1}) \varphi_2(a) = \frac{1}{|H|} \sum_{b \in G} \varphi_1(b) \varphi_2(b^{-1} g). \quad (2.1.4)$$

Furthermore, there is an action of $\mathcal{H}(G, H)$ on M , where, for $\varphi \in \mathcal{H}(G, H)$, $f \in M$, and $g \in G$, one has

$$(\varphi \cdot f)(g) := \frac{1}{|H|} \sum_{x \in G} \varphi(x) f(x^{-1} g). \quad (2.1.5)$$

One easily checks that this is well defined (by which we mean that $\varphi \cdot f \in M$).

It is clear that $\mathcal{H}(G, H)$ may be identified with \mathbb{C} -valued functions on $H \backslash G / H$, and hence it has a basis indexed by the double H -cosets in G . Let $W \subseteq G$ be a set of double coset representatives which contains e (the identity element of G), so that

$$G = \coprod_{w \in W} H w H. \quad (2.1.6)$$

Then for $w \in W$, we will set

$$T_w := \mathbb{1}_{H w H};$$

these form a basis of $\mathcal{H}(G, H)$.

Proposition 2.1.7 ([I, Proposition 1.4]). *Under the convolution product (2.1.4), $\mathcal{H}(G, H)$ is an associative algebra with identity $T_e = \mathbb{1}_H$. The action (2.1.5) yields a unital embedding of algebras $\mathcal{H}(G, H) \rightarrow \text{End}_{\mathbb{C}} M$ whose image is $\text{End}_G M$. Thus we may identify*

$$\mathcal{H}(G, H) = \text{End}_G \text{Ind}_H^G \mathbb{1}_H.$$

Remark 2.1.8 (Relation to the group algebra). The group algebra $\mathbb{C}[G]$ may be realized as the space of functions $\sigma : G \rightarrow \mathbb{C}$ with the multiplication

$$*_G : \mathbb{C}[G] \otimes_{\mathbb{C}} \mathbb{C}[G] \rightarrow \mathbb{C}[G], \quad (\sigma_1 *_G \sigma_2)(x) = \sum_{a \in G} \sigma_1(a) \sigma_2(a^{-1} x).$$

It is clear that we have an embedding of vector spaces

$$\iota : \mathcal{H}(G, H) \hookrightarrow \mathbb{C}[G]$$

and it is easy to see that if $\varphi_1, \varphi_2 \in \mathcal{H}(G, H)$ then

$$\iota(\varphi_1) *_G \iota(\varphi_2) = |H|(\varphi_1 * \varphi_2), \quad (2.1.9)$$

where the convolution product on the right hand side is in $\mathcal{H}(G, H)$. Furthermore, the inclusion takes the identity element $T_e \in \mathcal{H}(G, H)$ to $\mathbb{1}_H$, which is not the identity element in $\mathbb{C}[G]$. Thus, while the relationship between multiplication in $\mathcal{H}(G, H)$ and that in $\mathbb{C}[G]$ will be important for us, we should be careful to note that ι is not an algebra homomorphism. When we deal with indicator functions for double H -cosets, we will write $T_v, v \in W$, when we consider it as an element of $\mathcal{H}(G, H)$, and $\mathbb{1}_{HvH}$ when we think of it as an element of $\mathbb{C}[G]$. We will also be careful to indicate the subscript in $*_G$ when we mean multiplication in the group algebra (as opposed to the Hecke algebra).

We will need some refinements regarding Hecke algebras taken with respect to different subgroups.

2.1.1. Quotients. Let G be a group, $H \leq G$ a subgroup, and suppose that $H = K \rtimes L$ for some subgroups $K, L \leq H$. Our goal is to show that there is a natural surjection $\mathcal{H}(G, K) \twoheadrightarrow \mathcal{H}(G, H)$. We note that since $K \leq H$, there is an obvious inclusion of vector spaces $\mathcal{H}(G, H) \subseteq \mathcal{H}(G, K)$, when thought of as bi-invariant G -valued functions. We will write $*_K$ and $*_H$ for the convolution product in the respective Hecke algebras. From (2.1.9), we easily see that for $\varphi_1, \varphi_2 \in \mathcal{H}(G, H)$,

$$\varphi_1 *_K \varphi_2 = |L|(\varphi_1 *_H \varphi_2). \tag{2.1.10}$$

Let $W = W^K \subseteq G$ be a set of double K -coset representatives such that $L \subseteq W$; note that $K\ell K = \ell K = K\ell$ for $\ell \in L$. If $\ell \in L$ and $w \in W$, then it follows from [I, Lemma 1.2] that $T_\ell *_K T_w = T_{\ell w}$. From this it is easy to see that

$$E = E_L := \frac{1}{|L|} \sum_{\ell \in L} T_\ell$$

is an idempotent in $\mathcal{H}(G, K)$. In fact, $E = |L|^{-1}\mathbb{1}_H = |L|^{-1}\mathbb{1}_{\mathcal{H}(G, H)}$, thought of as bi-invariant functions on G .

Lemma 2.1.11. *If $W^K \subseteq N_G(L)$ then E is central in $\mathcal{H}(G, K)$.*

Proof. It is enough to show that $E *_K T_w = T_w *_K E$ for any $w \in W$. One has

$$\begin{aligned} E *_K T_w &= \frac{1}{|L||K|} \sum_{\ell \in L} T_\ell *_K T_w = \frac{1}{|H|} \sum_{\ell \in L} T_{\ell w} = \frac{1}{|H|} \sum_{\ell \in L} T_{w(w^{-1}\ell w)} = \frac{1}{|H|} \sum_{m \in L} T_{wm} \\ &= T_w *_K E. \end{aligned} \quad \square$$

Proposition 2.1.12. *If E is central in $\mathcal{H}(G, K)$ then there exists a surjective algebra homomorphism $\mathcal{H}(G, K) \rightarrow \mathcal{H}(G, H)$ which takes $\mathbb{1}_{\mathcal{H}(G, K)}$ to $\mathbb{1}_{\mathcal{H}(G, H)}$, given by*

$$\alpha \mapsto |L|(E *_K \alpha).$$

Proof. It is easy to check that this map is well defined, i.e., if α is K -bi-invariant, then $|L|(E *_K \alpha)$ is H -bi-invariant. To check that the map preserves the convolution product, one uses the fact that E is a central idempotent and (2.1.10) to see that

$$|L|(E *_K (\alpha *_K \beta)) = |L|((E *_K \alpha) *_K (E *_K \beta)) = |L|(E *_K \alpha) *_H |L|(E *_K \beta).$$

By the remark preceding Lemma 2.1.11, this map preserves the identity. Finally, it is surjective, because given $\varphi \in \mathcal{H}(G, H)$, as mentioned above we may think of it as an element of $\mathcal{H}(G, K)$ and we find $|L|^{-1}\varphi \mapsto \alpha$. \square

2.1.2. Inclusions. Suppose now that G is a group, $L, H \leq G$ are subgroups and let $K := H \cap L$. Assume $H = K \rtimes U$ for some subgroup $U \leq G$ and $L \leq N_G(U)$. We write $*_K$ and $*_H$ for the convolution products in $\mathcal{H}(L, K)$ and $\mathcal{H}(G, H)$, respectively.

Lemma 2.1.13. *Suppose $x, y \in L$ are such that $x \in HyH$. Then $x \in KyK$.*

Proof. We write $x = h_1yh_2$ for some $h_1, h_2 \in H$. Since $H = K \rtimes U$, we may write $h_1 = ku$ for some $k \in K$ and $u \in U$. Then $x = ky(y^{-1}uy)h_2$, but since $y \in L \leq N_G(U)$, we have $v := y^{-1}uy \in U \leq H$ and so $vh_2 \in H$. But also $vh_2 = (ky)^{-1}x \in L$, so $vh_2 \in K = H \cap L$, and hence $x = ky(vh_2) \in KyK$. \square

Proposition 2.1.14. *One has an inclusion of Hecke algebras $\mathcal{H}(L, K) \hookrightarrow \mathcal{H}(G, H)$, taking $\mathbb{1}_{\mathcal{H}(L, K)}$ to $\mathbb{1}_{\mathcal{H}(G, H)}$, given by $\varphi \mapsto \varphi^H$, where*

$$\varphi^H(g) := \frac{1}{|K|} \sum_{x \in L} \varphi(x) \mathbb{1}_H(x^{-1}g).$$

Proof. It is clear that this is a map of vector spaces. To show that it preserves multiplication, let $\varphi_1, \varphi_2 \in \mathcal{H}(L, K)$. Then

$$\begin{aligned} (\varphi_1^H *_H \varphi_2^H)(g) &= \frac{1}{|H|} \sum_{a \in G} \varphi_1(a) \varphi_2(a^{-1}g) \\ &= \frac{1}{|H||K|^2} \sum_{\substack{x, y \in L \\ a \in G}} \varphi_1(y) \mathbb{1}_H(y^{-1}a) \varphi_2(x) \mathbb{1}_H(x^{-1}a^{-1}g) \\ &= \frac{1}{|U||K|^3} \sum_{\substack{x, y \in L \\ a \in yH}} \varphi_1(y) \varphi_2(x) \mathbb{1}_H(x^{-1}a^{-1}g) \\ &= \frac{1}{|U||K|^3} \sum_{\substack{x, y \in L \\ h \in H}} \varphi_1(y) \varphi_2(x) \mathbb{1}_H(x^{-1}h^{-1}y^{-1}g) \\ &= \frac{1}{|U||K|^3} \sum_{\substack{x, y \in L \\ k \in K, u \in U}} \varphi_1(y) \varphi_2(x) \mathbb{1}_H(x^{-1}k^{-1}u^{-1}y^{-1}g). \end{aligned}$$

After the substitution $x = k^{-1}z$, this becomes

$$\begin{aligned} (\varphi_1^H *_{\mathcal{H}} \varphi_2^H)(g) &= \frac{1}{|U||K|^3} \sum_{\substack{y,z \in L \\ k \in K, u \in U}} \varphi_1(y)\varphi_2(k^{-1}z)\mathbb{I}_H(z^{-1}u^{-1}y^{-1}g) \\ &= \frac{1}{|U||K|^2} \sum_{\substack{y,z \in L \\ u \in U}} \varphi_1(y)\varphi_2(z)\mathbb{I}_H((z^{-1}u^{-1}z)z^{-1}y^{-1}g) \\ &= \frac{1}{|K|^2} \sum_{y,z \in L} \varphi_1(y)\varphi_2(z)\mathbb{I}_H(z^{-1}y^{-1}g) \end{aligned}$$

and with $z = y^{-1}x$,

$$\begin{aligned} (\varphi_1^H *_{\mathcal{H}} \varphi_2^H)(g) &= \frac{1}{|K|^2} \sum_{x,y \in L} \varphi_1(y)\varphi_2(y^{-1}x)\mathbb{I}_H(x^{-1}g) \\ &= \frac{1}{|K|} \sum_{x \in L} (\varphi_1 *_{\mathcal{K}} \varphi_2)(x)\mathbb{I}_H(x^{-1}g) = (\varphi_1 *_{\mathcal{K}} \varphi_2)^H(g). \end{aligned}$$

It is easy to see that $\mathbb{1}_{\mathcal{H}(L,K)}^{\mathbb{H}} = \mathbb{I}_K^H = \mathbb{I}_H = \mathbb{1}_{\mathcal{H}(G,H)}$, so we do indeed get a map of algebras.

To see that it is injective, let $V \subseteq L$ be a set of double K -coset representatives, so that $\{T_x^{\mathcal{H}(L,K)}\}_{x \in V}$ is a basis of $\mathcal{H}(L, K)$. Lemma 2.1.13 says that if W is a set of double H -coset representatives in G , then we may take $V \subseteq W$. We write $\{T_w^{\mathcal{H}(G,H)}\}_{w \in W}$ for the corresponding basis of $\mathcal{H}(G, H)$, with the superscripts denoting which Hecke algebra the element lies in. Then we observe that

$$(T_x^{\mathcal{H}(L,K)})^H(x) = \frac{1}{|K|} \sum_{y \in L} T_x^{\mathcal{H}(L,K)}(y)\mathbb{I}_H(y^{-1}x) = \frac{1}{|K|} \sum_{y \in KxK} \mathbb{I}_H(y^{-1}x) > 0.$$

This says that the $T_x^{\mathcal{H}(G,H)}$ -component of $(T_x^{\mathcal{H}(L,K)})^H$ is non-zero, but as $V \subseteq W$, the set $\{T_x^{\mathcal{H}(G,H)}\}_{x \in V}$ is linearly independent, and hence so is the image $\{(T_x^{\mathcal{H}(L,K)})^H\}_{x \in V}$ of the basis of $\mathcal{H}(L, K)$. \square

2.2. Iwahori–Hecke algebras of type A_{n-1}

Let G be the algebraic group GL_n defined over the finite field \mathbb{F}_q . Let $T \leq G$ be the maximal split torus of diagonal matrices. There will be a corresponding root system with Weyl group \mathfrak{S}_n , the symmetric group on n letters, which we will identify with the group of permutation matrices. Let $B \leq G$ be the Borel subgroup of upper triangular matrices. Let the finite-dimensional algebra $\mathcal{H}(G, B)$ be as defined above. The Bruhat decomposition for G , with respect to B , allows us to think of \mathfrak{S}_n as a set of double B -coset representatives, and hence $\{T_w\}_{w \in \mathfrak{S}_n}$ gives a basis of $\mathcal{H}(G, B)$. Furthermore, the choice of B determines a set of simple reflections $\{s_1, \dots, s_{n-1}\} \subseteq \mathfrak{S}_n$; we will write $T_i := T_{s_i}$. The main result of [I, Theorem 3.2] gives the following characterization of $\mathcal{H}(G, B)$ in terms of generators and relations:

- (a) If $w = s_{i_1} \cdots s_{i_k}$ is a reduced expression for $w \in \mathfrak{S}_n$, then $T_w = T_{i_1} \cdots T_{i_k}$. Hence $\mathcal{H}(G, B)$ is generated as an algebra by T_1, \dots, T_ℓ .
- (b) For $1 \leq i \leq \ell$, $T_i^2 = qT_i + (q-1)1$.

2.2.1. *A generic deformation.* If u is an indeterminate over \mathbb{C} , we may consider the $\mathbb{C}[u^{\pm 1}]$ -algebra H_n generated by elements T_1, \dots, T_{n-1} subject to the relations

- (a) $T_i T_j = T_j T_i$ for all $i, j = 1, \dots, n-1$ such that $|i-j| > 1$;
 (b) $T_i T_{i+1} T_i = T_{i+1} T_i T_{i+1}$ for all $i = 1, \dots, n-2$;
 (c) $T_i^2 = u \cdot 1 + (u-1)T_i$;

H_n is called the *generic Iwahori–Hecke algebra of type A_{n-1} with parameter u* . Setting $u = 1$, we see that the generators satisfy the relations of the generating transpositions for \mathfrak{S}_n , and [I, Theorem 3.2] shows that for $u = q$ these relations give the Iwahori–Hecke algebra above, so (cf. [CR, (68.11) Proposition])

$$H_n(1) \cong \mathbb{C}[\mathfrak{S}_n], \quad H_n(q) \cong \mathcal{H}(G, B). \quad (2.2.1)$$

2.3. Yokonuma–Hecke algebras

Let $T \leq B \leq G$ be as in the previous example, and let $U \leq B$ be the unipotent radical of B , namely, the group of upper triangular unipotent matrices. Then the algebra $\mathcal{H}(G, U)$, first studied in [Y1], is called the *Yokonuma–Hecke algebra* associated to G, B, T . Let $N(T)$ be the normalizer of T in G ; $N(T)$ is the group of monomial matrices (i.e., those matrices for which each row and each column has exactly one non-zero entry) and one has $N(T) = T \rtimes \mathfrak{S}_n$, where the Weyl group \mathfrak{S}_n acts by permuting the entries of a diagonal matrix. We will often write N for $N(T)$. By the Bruhat decomposition, one may take $N \leq G$ as a set of double U -coset representatives. Section 2.1 describes how $\mathcal{H}(G, U)$ has a basis $\{T_v : v \in N(T)\}$.

2.3.1. *A generic deformation.* The algebra $\mathcal{H}(G, U)$ has a presentation in terms of generators and relations due to [Y1, Y2], which we now describe and which we will make use of later on. For this consider the $\mathbb{C}[u^{\pm 1}]$ -algebra $Y_{d,n}$ generated by the elements

$$T_i, \quad i = 1, \dots, n-1, \quad \text{and} \quad h_j, \quad j = 1, \dots, n,$$

subject to the following relations:

- (a) $T_i T_j = T_j T_i$ for all $i, j = 1, \dots, n-1$ such that $|i-j| > 1$;
 (b) $T_i T_{i+1} T_i = T_{i+1} T_i T_{i+1}$ for all $i = 1, \dots, n-2$;
 (c) $h_i h_j = h_j h_i$ for all $i, j = 1, \dots, n$;
 (d) $h_j T_i = T_i h_{s_i(j)}$ for all $i = 1, \dots, n-1$ and $j = 1, \dots, n$, where $s_i := (i, i+1) \in \mathfrak{S}_n$;
 (e) $h_i^d = 1$ for all $i = 1, \dots, n$;

(f) $T_i^2 = uf_i f_{i+1} + (u - 1)e_i T_i$ for $i = 1, \dots, n - 1$, where

$$e_i := \frac{1}{d} \sum_{j=1}^d h_i^j h_{i+1}^{-j} \quad \text{for } i = 1, \dots, n - 1, \tag{2.3.1}$$

$$f_i := \begin{cases} h_i^{d/2} & \text{for } d \text{ even,} \\ 1 & \text{for } d \text{ odd,} \end{cases} \quad \text{for } i = 1, \dots, n. \tag{2.3.2}$$

In Theorem 2.4.3 below, we will see that $\mathcal{H}(G, U)$ arises as the specialization $Y_{q-1,n}(q)$.

Remark 2.3.3. The modern definition of $Y_{d,n}$ in terms of generators and relations takes $f_i = 1$, regardless of the parity of d (cf. [CPA] and [J2]). We decided to take that of [Y1] so that the meaning of the generators is more transparent. Again, this will be clearer from Theorem 2.4.3 and its proof.

2.4. Some computations in $\mathcal{H}(G, U)$ and $Y_{d,n}(u)$

We continue with the context of the previous subsection. There is a canonical surjection $p : N \rightarrow \mathfrak{S}_n$, which allows us to define the length of an element $v \in N$ to be that of $p(v)$; we will denote this length by $\ell(v)$.

Lemma 2.4.1. *If $v_1, v_2 \in N$ are such that $\ell(v_1 v_2) = \ell(v_1) + \ell(v_2)$, then $T_{v_1} * T_{v_2} = T_{v_1 v_2}$. In particular, if $h \in T$ and $v \in N$ then $T_h * T_v = T_{hv}$.*

Proof. This follows readily from [I, Lemma 1.2] and the fact that, in the notation there, $\text{ind}(v) = q^{\ell(v)}$ for $v \in N$. □

Our first task is to describe the relationship of $Y_{d,n}$ to $\mathcal{H}(G, U)$, as alluded to at the beginning of Section 2.3.1. To do this, we follow the approach in [GP, (7.4), (8.1.6)]. For example, the $u = 1$ specialization of $Y_{q-1,n}$ gives

$$Y_{q-1,n}(1) = \mathbb{C} \otimes_{\theta_1} Y_{q-1,n} \cong \mathbb{C}[N] = \mathbb{C}[(\mathbb{F}_q^\times)^n \rtimes \mathfrak{S}_n], \tag{2.4.2}$$

the group algebra of the normalizer in G of the torus $T(\mathbb{F}_q)$.

Theorem 2.4.3. *Let q be a prime power and fix a multiplicative generator $t_g \in \mathbb{F}_q^\times$. For $t \in \mathbb{F}_q^\times$, let $h_i(t) \in T$ be the diagonal matrix obtained by replacing the i th diagonal entry of the identity matrix by t . Finally, let $s_i \in N$ denote the permutation matrix corresponding to $(i, i + 1)$ and*

$$\omega_i := s_i h_i(-1) = h_{i+1}(-1) s_i \in N.$$

Then one has an isomorphism $Y_{q-1,n}(q) \cong \mathcal{H}(G, U)$ of \mathbb{C} -algebras under which

$$T_i \mapsto T_{\omega_i} \in \mathcal{H}(G, U) \quad \text{and} \quad h_i \mapsto T_{h_i(t_g)} \in \mathcal{H}(G, U).$$

Note that ω_i is the matrix obtained by replacing the 2×2 submatrix of the identity matrix formed by the i th and $(i + 1)$ st rows and columns by

$$\begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}.$$

Proof of Theorem 2.4.3. It is sufficient to show that $T_{\omega_i}, T_{h_j(t_g)}$ satisfy the relations prescribed for T_i, h_j in Section 2.3.1. Lemma 2.4.1 makes most of these straightforward. The computation in [Y1, Théorème 2.4°] gives

$$T_{\omega_i}^2 = qT_{h_i(-1)h_{i+1}(-1)} + \sum_{t \in \mathbb{F}_q^\times} T_{h_i(t)h_{i+1}(t^{-1})}T_{\omega_i},$$

which is (f). □

The longest element $w_0 \in W = \mathfrak{S}_n$ is the permutation $\prod_{i=1}^{\lfloor n/2 \rfloor} (i, n + 1 - i)$ (the order of the factors is immaterial since this is a product of disjoint transpositions) and is of length $\binom{n}{2}$. We may choose a reduced expression

$$w_0 = s_{i_1} \cdots s_{i_{\binom{n}{2}}}. \tag{2.4.4}$$

With the same indices as in (2.4.4), we define

$$\omega_0 := \omega_{i_1} \cdots \omega_{i_{\binom{n}{2}}} \in N \quad \text{and} \quad T_0 := T_{i_1} \cdots T_{i_{\binom{n}{2}}} \in Y_{d,n}. \tag{2.4.5}$$

Using the braid relations (a) and (b) and arguing as for Matsumoto’s Theorem [GP, Theorem 1.2.2], one sees that T_0 is independent of the choice of reduced expression (2.4.4). Now, Lemma 2.4.1 shows that

$$T_{\omega_0} = T_{\omega_{i_1}} \cdots T_{\omega_{i_{\binom{n}{2}}}} \in \mathcal{H}(G, U)$$

and Theorem 2.4.3 shows that this corresponds to $T_0 \in Y_{q-1,n}(q)$.

Lemma 2.4.6. *The element T_0^2 is central in $Y_{d,n}$. It follows, by specialization, that $T_{\omega_0}^2$ is central in $\mathcal{H}(G, U)$.*

Proof. Proceeding as in [GP, §4.1], we define a monoid B^+ generated by

$$T_1, \dots, T_{n-1}, h_1, \dots, h_n$$

subject to the relations

- (a) $T_i T_j = T_j T_i$ for $1 \leq i, j \leq n - 1$ with $|i - j| > 1$;
- (b) $T_i T_{i+1} T_i = T_{i+1} T_i T_{i+1}$ for $1 \leq i \leq n - 2$;
- (c) $h_j T_i = T_i h_{s_i(j)}$ for $1 \leq i \leq n - 1$ and $1 \leq j \leq n$, where $s_i := (i, i + 1) \in \mathfrak{S}_n$.

Observe that these are simply relations (a), (b) and (d) given for $Y_{d,n}$ in Section 2.3.1; one can define the monoid algebra $\mathbb{C}[u^{\pm 1}][B^+]$ of which $Y_{d,n}$ will be a quotient via the mapping

$$T_i \mapsto T_i, \quad h_j \mapsto h_j,$$

for $1 \leq i \leq n - 1$ and $1 \leq j \leq n$.

Letting

$$T_0 := T_{i_1} \cdots T_{i_{\binom{n}{2}}} \in \mathbb{C}[u^{\pm 1}][B^+],$$

it is enough to show that T_0 is central in $\mathbb{C}[u^{\pm 1}][B^+]$. Arguing as in the proof of [GP, Lemma 4.1.9], one sees that T_0^2 commutes with each T_i , $1 \leq i \leq n - 1$. Furthermore, relation (c) and (3.2.5) give

$$h_j T_0^2 = T_0^2 h_{w_0^2(j)} = T_0^2 h_j,$$

provided we note that $w_0^2 = 1$ implies $w_0 = w_0^{-1} = s_{i_{\binom{n}{2}}} \cdots s_{i_1}$. □

The following will be useful when we look at representations.

Lemma 2.4.7. *The element e_i defined in (2.3.1) commutes with T_i in $Y_{d,n}(u)$.*

Proof. By relation (d), we see that $T_i(h_i^j h_{i+1}^{-j}) = (h_i^{-j} h_{i+1}^j) T_i$. The lemma follows by averaging over $j = 1, \dots, d$ and observing that both h_i and h_{i+1} have order d . □

Lemma 2.4.8. *The elements $T_1, \dots, T_{n-1} \in Y_{d,n}(u)$ are all conjugate.*

Proof. From relation (f) in Section 2.3.1, we see that each T_i is invertible, with inverse

$$T_i^{-1} = u^{-1}(T_i - (u - 1)e_i)f_i f_{i+1}.$$

Then

$$(T_i T_{i+1} T_i) T_{i+1} (T_i T_{i+1} T_i)^{-1} = (T_i T_{i+1} T_i) T_{i+1} (T_{i+1} T_i T_{i+1})^{-1} = T_i,$$

and the statement follows by transitivity of the conjugacy relation. □

2.5. The double centralizer theorem

The following is taken from [KP, §3.2]. Let \mathbb{K} be an arbitrary field, A a finite-dimensional algebra over \mathbb{K} , and W a finite-dimensional (left) A -module. Recall that W is said to be *semisimple* if it decomposes as a direct sum of irreducible submodules. If A is semisimple as a module over itself then it is called a *semisimple algebra*; the Artin–Wedderburn theorem then states that any such A is a product of matrix algebras over (finite-dimensional) division \mathbb{K} -algebras. If U is a finite-dimensional simple A -module, then the *isotypic component of W of type U* is the direct sum of all submodules of W isomorphic to U . The isotypic components are then direct summands of W and their sum gives a decomposition of W precisely when the latter is semisimple; in this case, it is called the *isotypic decomposition of W* . We recall the following, which is often called the “double centralizer theorem.”

Theorem 2.5.1. *Let W a finite-dimensional vector space over \mathbb{K} , let $A \subseteq \text{End}_{\mathbb{K}} W$ be a semisimple subalgebra, and let*

$$A' = \text{End}_A W := \{b \in \text{End}_{\mathbb{K}} W : ab = ba \ \forall a \in A\}$$

be its centralizer subalgebra. Then A' is also semisimple and there is a direct sum decomposition

$$W = \bigoplus_{i=1}^r W_i$$

which is the isotypic decomposition of W as either an A -module or an A' -module. In fact, for $1 \leq i \leq r$, there is an irreducible A -module U_i and an irreducible A' -module U'_i such that if $D_i := \text{End}_A U_i$ (this is a division \mathbb{K} -algebra by Schur's lemma), then $\text{End}_{A'} U'_i \cong D_i^{\text{op}}$ and

$$W_i \cong U_i \otimes_{D_i} U'_i.$$

Remark 2.5.2. If \mathbb{K} is algebraically closed, then there are no non-trivial finite-dimensional division algebras over \mathbb{K} , and so in the statement above, the tensor product is over \mathbb{K} .

We are interested in the case where $\mathbb{K} = \mathbb{C}$ (so within the scope of the above remark), H and G are as in Section 2.1, $W = \text{Ind}_H^G \mathbb{1}_H$ is the induction of the trivial representation of a subgroup $H \leq G$ to G , and A is the image of the group algebra $\mathbb{C}[G]$ in $\text{End}_{\mathbb{C}} W$. Then A is semisimple, and via Proposition 2.1.7 we know $A' = \mathcal{H}(G, H)$. We can then conclude the following.

Corollary 2.5.3. *The Hecke algebra $\mathcal{H}(G, H)$ is semisimple.*

Furthermore, one observes that the kernel of the induced representation $\text{Ind}_H^G \mathbb{1}_H$ is given by $\bigcap_{g \in G} gHg^{-1}$. Thus, applying Theorem 2.5.1 with $A = \mathcal{H}(G, H)$, since its commuting algebra is the image of the G -action, we may state the following.

Corollary 2.5.4. *If $\bigcap_{g \in G} gHg^{-1}$ is trivial, then*

$$\mathbb{C}[G] \cong \text{End}_{\mathcal{H}(G, H)} \text{Ind}_H^G \mathbb{1}_H.$$

2.6. Representations of Hecke algebras

We return to the abstract situation of Section 2.1. By a *representation of $\mathcal{H}(G, H)$* we will mean a pair (W, ρ) consisting of a finite-dimensional complex vector space V and an identity-preserving homomorphism $\rho : \mathcal{H}(G, H) \rightarrow \text{End}_{\mathbb{C}} W$. Let (V, π) be a representation of G and let $V^H \subseteq V$ be the subspace fixed by H . Then V^H is a representation of the Hecke algebra $\mathcal{H}(G, H)$ via the action

$$\varphi.v := \frac{1}{|H|} \sum_{a \in G} \varphi(a)\pi(a) \cdot v \tag{2.6.1}$$

for $\varphi \in \mathcal{H}(G, H)$ and $v \in V^H$. It is easy to check that $\varphi.v \in V^H$, so that this is well defined.

Note that upon choosing a basis vector for the trivial representation $\mathbb{1}_H$ of H , we may identify

$$\text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G V) \cong V^H$$

by taking an H -morphism to the image of the basis vector. Thus, we have defined a map

$$\mathbf{D}_H : \text{Rep } G \rightarrow \text{Rep } \mathcal{H}(G, H), \quad (V, \pi) \mapsto \text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G V) \cong V^H.$$

Let us now set

$$\text{Irr}(G : H) := \{ \zeta \in \text{Irr } G : (\zeta, \mathbb{1}_H^G) > 0 \}, \tag{2.6.2}$$

where $(,)$ is the pairing on characters; the condition is equivalent to $\text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G \zeta) \neq 0$. We can now give the following characterization of irreducible representations of $\mathcal{H}(G, H)$, which in the more general case of locally compact groups is [BZ, Proposition 2.10].

Proposition 2.6.3. *If (V, π) is an irreducible representation of G , then V^H is an irreducible representation of $\mathcal{H}(G, H)$, and every irreducible representation of $\mathcal{H}(G, H)$ arises in this way, that is, \mathbf{D}_H restricts to a bijection $\mathbf{D}_H : \text{Irr}(G : H) \xrightarrow{\sim} \text{Irr } \mathcal{H}(G, H)$.*

Since $\mathbb{C}[G]$ and $\mathcal{H}(G, H)$ are semisimple, we can apply Theorem 2.5.1 to $W = \text{Ind}_H^G \mathbb{1}_H$. If we denote the set of irreducible representations of G by $\text{Irr } G$, we find that

$$\text{Ind}_H^G \mathbb{1}_H = \bigoplus_{\substack{V \in \text{Irr } G \\ V^H \neq \{0\}}} V \otimes V^H, \tag{2.6.4}$$

with elements of G acting on the left side of the tensor product and those of $\mathcal{H}(G, H)$ acting on the right. One has a consistency check here: for an irreducible representation V of G , the multiplicity of V in $\text{Ind}_H^G \mathbb{1}_H$ is given by

$$\dim \text{Hom}_G(\text{Ind}_H^G \mathbb{1}_H, V) = \dim \text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G V) = \dim V^H,$$

which is confirmed by the decomposition in (2.6.4).

2.6.1. Traces. Let $M \cong \text{Ind}_H^G \mathbb{1}_H$ be as in Section 2.1. Observe that if $X \in \text{End}_{\mathbb{C}} M$, then relative to the basis (2.1.2), its trace is computed as

$$\text{tr}_M X = \sum_{v \in V} (X.f_v)(v).$$

Lemma 2.6.5. *Let $g \in G$ and $\varphi \in \mathcal{H}(G, H)$ and consider $g\varphi = \varphi g \in \text{End}_{\mathbb{C}} \text{Ind}_H^G \mathbb{1}_H$ (where g is thought of as an element of $\text{End}_{\mathbb{C}} \text{Ind}_H^G \mathbb{1}_H$ via (2.1.3)). Then*

$$\text{tr}(g\varphi) = \frac{1}{|H|} \sum_{x \in G} \varphi(xgx^{-1}) = \sum_{V \in \text{Irr}(G:H)} \chi_V(g) \chi_{\mathbf{D}_H(V)}(\varphi)$$

where χ_V is the character of the G -module V , and $\chi_{\mathbf{D}_H(V)}$ is that of the $\mathcal{H}(G, H)$ -module $\mathbf{D}_H(V)$.

Proof. In the notation of (2.1.2),

$$\begin{aligned} |H| \operatorname{tr}(g\varphi) &= |H| \sum_{v \in V} ((g\varphi) \cdot f_v)(v) = |H| \sum_{v \in V} (\varphi \cdot f_v)(vg) = \sum_{v \in V} \sum_{y \in G} \varphi(y) f_v(y^{-1}vg) \\ &= \sum_{v \in V} \sum_{y^{-1}vg \in H_v} \varphi(y) = \sum_{v \in V} \sum_{y \in vgv^{-1}H} \varphi(y) = \sum_{v \in V} \sum_{h \in H} \varphi(vgv^{-1}h^{-1}) \\ &= \sum_{v \in V} \sum_{h \in H} \varphi((hv)g(hv)^{-1}) = \sum_{x \in G} \varphi(xgx^{-1}), \end{aligned}$$

where we use (2.1.1) at the last line. On the other hand, if g, φ are as in the lemma, then applying $g\varphi = \varphi g$ to the decomposition (2.6.4), we get

$$\operatorname{tr}(g\varphi) = \sum_{V \in \operatorname{Irr}(G:H)} \chi_V(g) \chi_{\mathbf{D}_H(V)}(\varphi). \quad \square$$

2.6.2. Induced representations. Let G, H, L, K and U be as in Section 2.1.2. Then one sees that $L \cap U$ is trivial and hence we may define $P := L \times U$. The inclusion $\mathcal{H}(L, K) \hookrightarrow \mathcal{H}(G, H)$ given by Proposition 2.1.14 allows us to induce representations from $\mathcal{H}(L, K)$ to $\mathcal{H}(G, H)$: if V is an $\mathcal{H}(L, K)$ -representation, then

$$\operatorname{Ind}_{\mathcal{H}(L,K)}^{\mathcal{H}(G,H)} V := \mathcal{H}(G, H) \otimes_{\mathcal{H}(L,K)} V,$$

yielding a map $\operatorname{Rep} \mathcal{H}(L, K) \rightarrow \operatorname{Rep} \mathcal{H}(G, H)$.

We also have a ‘‘parabolic induction’’ functor: for $V \in \operatorname{Rep} L$, we define

$$R_L^G V := \operatorname{Ind}_P^G \operatorname{Infl}_L^P V, \tag{2.6.6}$$

which gives a map $\operatorname{Rep} L \rightarrow \operatorname{Rep} G$. Let $\operatorname{Rep}(G : H)$ denote the set of isomorphism classes of (finite-dimensional) representations of G at least one of whose irreducible components lies in $\operatorname{Irr}(G : H)$. We claim that if $V \in \operatorname{Irr}(L : K)$, then $R_L^G V \in \operatorname{Rep}(G : H)$ and hence R_L^G yields a map

$$R_L^G : \operatorname{Irr}(L : K) \rightarrow \operatorname{Rep}(G : H).$$

We know that $V \in \operatorname{Irr}(L : K)$ if and only if $\operatorname{Hom}_K(\mathbb{1}_K, \operatorname{Res}_K^L V) \neq 0$. The latter implies

$$0 \neq \operatorname{Hom}_H(\mathbb{1}_H, \operatorname{Res}_H^P \operatorname{Infl}_L^P V) = \operatorname{Hom}_P(\operatorname{Ind}_H^P \mathbb{1}_H, \operatorname{Infl}_L^P V).$$

Now, inducing to G in both factors¹ yields

$$\begin{aligned} 0 &\neq \operatorname{Hom}_G(\operatorname{Ind}_P^G \operatorname{Ind}_H^P \mathbb{1}_H, \operatorname{Ind}_P^G \operatorname{Infl}_L^P V) = \operatorname{Hom}_G(\operatorname{Ind}_H^G \mathbb{1}_H, R_L^G V) \\ &= \operatorname{Hom}_H(\mathbb{1}_H, \operatorname{Res}_H^G R_L^G V), \end{aligned}$$

which proves the claim.

Our goal here is to show that \mathbf{D} -operators are compatible with these induction operations. Here is the precise statement.

¹ If $B \in \operatorname{Irr} P$, then $\mathbb{1}_{\operatorname{Ind} B} \in \operatorname{End}_G(\operatorname{Ind}_P^G B, \operatorname{Ind}_P^G B)$, so $\operatorname{Hom}_P(B, \operatorname{Res}_P^G \operatorname{Ind}_P^G B) \neq 0$, and thus B is an irreducible component of $\operatorname{Res}_P^G \operatorname{Ind}_P^G B$. It follows that if A and B are any P -representations with $\operatorname{Hom}_P(A, B) \neq 0$ then $\operatorname{Hom}_G(\operatorname{Ind}_P^G A, \operatorname{Hom}_P^G B) \neq 0$.

Proposition 2.6.7. *Assume that $\bigcap_{\ell \in L} \ell K \ell^{-1}$ is trivial. Then the following diagram commutes:*

$$\begin{array}{ccc} \text{Irr}(L : K) & \xrightarrow{\mathbf{D}_K} & \text{Irr } \mathcal{H}(L, K) \\ R_L^G \downarrow & & \downarrow \text{Ind} \\ \text{Rep}(G : H) & \xrightarrow{\mathbf{D}_H} & \text{Rep } \mathcal{H}(G, H) \end{array}$$

Proof. By the assumption, Lemma 2.5.4 gives us

$$\mathbb{C}[L] \cong \text{End}_{\mathcal{H}(L, K)} \text{Ind}_K^L \mathbb{1}_K = \text{Ind}_K^L \mathbb{1}_K \otimes_{\mathcal{H}(L, K)} (\text{Ind}_K^L \mathbb{1}_K)^*.$$

Therefore, given $V \in \text{Irr}(L : K)$, we may rewrite this as

$$V \cong \mathbb{C}[L] \otimes_{\mathbb{C}[L]} V = \text{Ind}_K^L \mathbb{1}_K \otimes_{\mathcal{H}(L, K)} (\text{Ind}_K^L \mathbb{1}_K)^* \otimes_{\mathbb{C}[L]} V \tag{2.6.8}$$

where now we are taking the L -action on the first factor $\text{Ind}_K^L \mathbb{1}_K$. Since

$$(\text{Ind}_K^L \mathbb{1}_K)^* \otimes_{\mathbb{C}[L]} V = \text{Hom}_L(\text{Ind}_K^L \mathbb{1}_K, V) = \text{Hom}_K(\mathbb{1}_K, \text{Res}_K^L V) = \mathbf{D}_K(V),$$

(2.6.8) gives

$$V \cong \text{Ind}_K^L \mathbb{1}_K \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V).$$

Now, applying R_L^G to both sides, one gets

$$R_L^G V \cong R_L^G (\text{Ind}_K^L \mathbb{1}_K \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V)) = R_L^G (\text{Ind}_K^L \mathbb{1}_K) \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V), \tag{2.6.9}$$

as the L -action is on the first factor. Now, using the natural isomorphisms of functors

$$\text{Infl}_L^P \text{Ind}_K^L = \text{Ind}_H^P \text{Infl}_K^H, \quad \text{Ind}_P^G \text{Ind}_H^P = \text{Ind}_H^G$$

and the fact that $\text{Infl}_K^H \mathbb{1}_K = \mathbb{1}_H$, we can simplify

$$R_L^G (\text{Ind}_K^L \mathbb{1}_K) = \text{Ind}_P^G \text{Infl}_L^P \text{Ind}_K^L \mathbb{1}_K = \text{Ind}_P^G \text{Ind}_H^P \text{Infl}_K^H \mathbb{1}_K = \text{Ind}_H^G \mathbb{1}_H,$$

and so (2.6.9) becomes

$$R_L^G V \cong \text{Ind}_H^G \mathbb{1}_H \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V).$$

Applying now the functor $\mathbf{D}_H = \text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G(-))$ to both sides, and again noting that the G -action on the right hand side is on the first factor, we get

$$\begin{aligned} \mathbf{D}_H(R_L^G V) &\cong \text{Hom}_H(\mathbb{1}_H, \text{Res}_H^G \text{Ind}_H^G \mathbb{1}_H) \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V) \\ &= \text{End}_G(\text{Ind}_H^G \mathbb{1}_H, \text{Ind}_H^G \mathbb{1}_H) \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V) \\ &= \mathcal{H}(G, H) \otimes_{\mathcal{H}(L, K)} \mathbf{D}_K(V) = \text{Ind}_{\mathcal{H}(L, K)}^{\mathcal{H}(G, H)} \mathbf{D}_K(V). \quad \square \end{aligned}$$

2.7. Character tables

We now review some facts about the character tables of some finite groups which will be used in our counting arguments later. In this section and later, if A is an abelian group, we often denote its group of characters by $\widehat{A} := \text{Hom}(A, \mathbb{C}^\times)$.

2.7.1. Character table of $\text{GL}_n(\mathbb{F}_q)$. We follow the presentation of [Ma, Chapter IV]. Fix a prime power q . Let $\Gamma_n := \widehat{\mathbb{F}_{q^n}^\times}$ be the dual group of $\mathbb{F}_{q^n}^\times$. For $n \mid m$, the norm maps $\text{Nm}_{n,m} : \mathbb{F}_{q^m}^\times \rightarrow \mathbb{F}_{q^n}^\times$ yield an inverse system, and hence the Γ_n form a direct system whose colimit we denote by

$$\Gamma := \varinjlim \Gamma_n.$$

There is a natural action of the Frobenius $\text{Frob}_q : \overline{\mathbb{F}_q}^\times \rightarrow \overline{\mathbb{F}_q}^\times$, given by $\gamma \mapsto \gamma^q$, restricting to each $\mathbb{F}_{q^n}^\times$ and hence inducing an action on each Γ_n and hence on Γ ; we identify Γ_n with $\Gamma^{\text{Frob}_q^n}$. Let Θ denote the set of Frob_q -orbits in Γ .

The *weighted size* of a partition $\lambda = (\lambda_1, \lambda_2, \dots) \in \mathcal{P}$ is

$$n(\lambda) := \sum_{i \geq 1} (i - 1)\lambda_i = \sum_{j \geq 1} \binom{\lambda'_j}{2}$$

where, as usual, $\lambda' = (\lambda'_1, \lambda'_2, \dots)$ is the conjugate partition of λ , i.e., λ'_i is the number of λ_j 's not smaller than i . The *hook polynomial* of λ is defined as

$$H_\lambda(q) := \prod_{\square \in \lambda} (q^{h(\square)} - 1) \tag{2.7.1}$$

where the product is taken over the boxes in the Ferrers diagram (cf. [Sta, 1.3]) of λ , and $h(\square)$ is the *hook length* of the box \square in position (i, j) defined as

$$h(\square) := \lambda_i + \lambda'_j - i - j + 1.$$

By [Ma, IV (6.8)] there is a bijection between the irreducible characters of $\text{GL}_n(q)$ and the set of functions $\Lambda : \Theta \rightarrow \mathcal{P}$ which are stable under the Frobenius action and having *total size*

$$|\Lambda| := \sum_{\gamma \in \Theta} |\gamma| |\Lambda(\gamma)|$$

equal to n . Under this correspondence, the character χ_Λ^G corresponding to Λ has degree

$$\frac{\prod_{i=1}^n (q^i - 1)}{q^{-n(\Lambda')} H_\Lambda(q)} \tag{2.7.2}$$

where

$$H_\Lambda(q) := \prod_{\gamma \in \Theta} H_{\Lambda(\gamma)}(q^{|\gamma|}), \tag{2.7.3}$$

$$n(\Lambda) := \sum_{\gamma \in \Theta} |\gamma| n(\Lambda(\gamma)). \tag{2.7.4}$$

Remark 2.7.5. There is a class of irreducible characters of $GL_n(\mathbb{F}_q)$, known as the unipotent characters, which are also parametrized by \mathcal{P}_n . Given $\lambda \in \mathcal{P}_n$, the associated unipotent character χ_λ^G is the one corresponding to, in the description above, the function $\Lambda_\lambda : \Theta \rightarrow \mathcal{P}$, where Λ_λ takes the (singleton) orbit of the trivial character in Γ_1 to $\lambda \in \mathcal{P}_n$ and all other orbits to the empty partition.

In fact, any $\psi \in \Gamma_1 = \widehat{\mathbb{F}_q^\times}$ is a singleton orbit of Frob_q and so we may view Γ_1 as a subset of Θ . Thus, if we let \mathcal{Q}_n denote the set of maps $\Lambda : \Gamma_1 \rightarrow \mathcal{P}$ of total size n , i.e.,

$$|\Lambda| = \sum_{\psi \in \Gamma_1} |\Lambda(\psi)| = n,$$

then \mathcal{Q}_n is a set of maps $\Theta \rightarrow \mathcal{P}$ of size n . The set of characters of $GL_n(\mathbb{F}_q)$ corresponding to the maps in \mathcal{Q}_n will also be important for us later.

The following description of the characters corresponding to \mathcal{Q}_n can be found in the work of Green [Gr]. Suppose n_1, n_2 are such that $n = n_1 + n_2$. Let $L = GL_{n_1}(\mathbb{F}_q) \times GL_{n_2}(\mathbb{F}_q)$ and view it as the subgroup of $GL_n(\mathbb{F}_q)$ of block diagonal matrices, $U_{12} \leq G$ the subgroup of upper block unipotent matrices, and $P := L \times U_{12}$ the parabolic subgroup of block upper triangular matrices. The \circ -product $- \circ - : \text{Irr } GL_{n_1}(\mathbb{F}_q) \times \text{Irr } GL_{n_2}(\mathbb{F}_q) \rightarrow \text{Rep } GL_n(\mathbb{F}_q)$ is defined as

$$\chi_1 \circ \chi_2 = R_L^G(\chi_1 \otimes \chi_2) = \text{Ind}_P^G \text{Infl}_L^P(\chi_1 \otimes \chi_2). \tag{2.7.6}$$

Now, given $\Lambda \in \mathcal{Q}_n$, we will often write $\psi_1, \dots, \psi_r \in \Gamma_1$ for the distinct elements for which $n_i := |\Lambda(\psi_i)| > 0$ (note that $\sum_i n_i = n$) and $\lambda_i := \Lambda(\psi_i)$. For each $1 \leq i \leq r$, we have the unipotent representation $\chi_{\lambda_i}^G$ of $GL_{n_i}(\mathbb{F}_q)$, described above, as well as the character $\psi_i^G := \psi_i \circ \det : GL_{n_i}(\mathbb{F}_q) \rightarrow \mathbb{F}_q^\times \rightarrow \mathbb{C}^\times$. Then the irreducible character χ_Λ^G of $GL_n(\mathbb{F}_q)$ associated to $\Lambda \in \mathcal{Q}_n$ is

$$\chi_\Lambda^G := (\chi_{\Lambda(\psi_1)}^G \otimes \psi_1^G) \circ \dots \circ (\chi_{\Lambda(\psi_r)}^G \otimes \psi_r^G). \tag{2.7.7}$$

The fact that it is irreducible is attributable to [Gr]. One may also think of the tuple of characters of the $GL_{n_i}(\mathbb{F}_q)$ as yielding one on the product, which may be viewed as the Levi of some parabolic subgroup of $GL_n(\mathbb{F}_q)$. Then the above \circ -product is the parabolic induction of the character on the Levi.

2.7.2. Character table of N . Recall the isomorphisms $N \cong T \times \mathfrak{S}_n = (\mathbb{F}_q^\times)^n \rtimes \mathfrak{S}_n$. Our aim is to describe $\text{Irr } N$, but let us begin with a description of the irreducible representations of each of its factors. One has $\text{Irr } T = \widehat{T}$, the dual group. Furthermore, it is well known that $\text{Irr } \mathfrak{S}_n$ is in natural bijection with the set \mathcal{P}_n of partitions of n : to $\lambda \in \mathcal{P}_n$ one associates the (left) submodule of $\mathbb{C}[\mathfrak{S}_n]$ spanned by its ‘‘Young symmetrizer’’ [FH, §4.1]; we will denote the resulting character by $\chi_\lambda^{\mathfrak{S}}$.

To describe $\text{Irr } N$ explicitly, we appeal to [Se, §8.2, Proposition 25], which treats the general situation of a semidirect product with abelian normal factor. If $\psi \in \widehat{T}$ then ψ extends to a (1-dimensional) character of $T \times \mathbf{Stab} \psi$ (note that if we identify $\widehat{T} = (\mathbb{F}_q^\times)^n$, then \mathfrak{S}_n acts by permutations) trivial on $\mathbf{Stab} \psi$; so now, given $\chi \in \text{Irr}(\mathbf{Stab} \psi)$, we get

$\psi \otimes \chi \in \text{Irr}(\mathbb{T} \rtimes \mathbf{Stab} \psi)$. The result cited above says that $\text{Ind}_{\mathbb{T} \rtimes \mathbf{Stab} \psi}^{\mathbb{N}} \psi \otimes \chi$ is irreducible and in fact all irreducible representations of \mathbb{N} arise this way (with the proviso that we get isomorphic representations if we start with characters in the \mathfrak{S}_n -orbit of ψ).

If we write $\psi = (\psi_1, \dots, \psi_n) \in (\widehat{\mathbb{F}}_q^\times)^n$, then $\mathbf{Stab} \psi \cong \mathfrak{S}_{n_1} \times \dots \times \mathfrak{S}_{n_r}$ where the n_i are the multiplicities with which the ψ_j appear. Further, $\chi \in \text{Irr}(\mathbf{Stab} \psi) = \text{Irr} \mathfrak{S}_{n_1} \times \dots \times \text{Irr} \mathfrak{S}_{n_r}$ so χ is an exterior tensor product $\chi_{\lambda_1}^{\mathfrak{S}} \otimes \dots \otimes \chi_{\lambda_r}^{\mathfrak{S}}$ with $\lambda_i \in \mathcal{P}_{n_i}$. Thus, from $\text{Ind} \psi \otimes \chi$, we may define a map $\Lambda : \Gamma_1 \rightarrow \mathcal{P}$ by setting $\Lambda(\psi_j) = \lambda_i$ where j is among the indices permuted by \mathfrak{S}_{n_i} , and letting $\Lambda(\varphi)$ be the empty partition if $\varphi \in \widehat{\mathbb{F}}_q^\times$ does not appear in ψ . In this way, we get a map $\Lambda : \Gamma_1 \rightarrow \mathcal{P}$ of total size n , i.e., an element of \mathcal{Q}_n defined in Remark 2.7.5.

Conversely, given $\Lambda \in \mathcal{Q}_n$, let $\psi_i \in \Gamma_1$, n_i and $\lambda_i \in \mathcal{P}_{n_i}$ be as in the paragraph preceding (2.7.7). Let $\mathbb{T}_i := (\widehat{\mathbb{F}}_q^\times)^{n_i}$ and set $\mathbb{N}_i := \mathbb{T}_i \rtimes \mathfrak{S}_{n_i}$. Observe that if $\psi \in \widehat{\mathbb{T}}$ is defined by taking the ψ_i with multiplicity n_i , then $\prod_{i=1}^r \mathbb{N}_i = \mathbb{T} \rtimes \mathbf{Stab} \psi$. Now, ψ_i defines a character of \mathbb{N}_i by

$$(t_1, \dots, t_{n_i}, \sigma) \mapsto \prod_{j=1}^{n_i} \psi_i(t_j),$$

and $\chi_{\lambda_i}^{\mathfrak{S}}$ defines an irreducible representation of \mathfrak{S}_{n_i} and hence of \mathbb{N}_i . Hence we get

$$\chi_{\lambda_i, \psi_i}^{\mathbb{N}_i} := \chi_{\lambda_i}^{\mathfrak{S}} \otimes \psi_i \in \text{Irr} \mathbb{N}_i.$$

Taking their exterior tensor product and then inducing to \mathbb{N} gives the irreducible representation

$$\chi_{\Lambda}^{\mathbb{N}} := \text{Ind}_{\prod \mathbb{N}_i}^{\mathbb{N}} \bigotimes_i \chi_{\lambda_i, \psi_i}^{\mathbb{N}_i} \in \text{Irr} \mathbb{N}. \tag{2.7.8}$$

It is in this way that we will realize the bijection $\mathcal{Q}_n \xrightarrow{\sim} \text{Irr} \mathbb{N}$.

It will be convenient to define for $\Lambda \in \mathcal{Q}_n$ the function $\tilde{\Lambda} \in \mathcal{Q}_n$ as

$$\tilde{\Lambda}(\psi) := \begin{cases} \Lambda(\psi)' & \text{for } \psi \text{ odd,} \\ \Lambda(\psi) & \text{for } \psi \text{ even,} \end{cases} \tag{2.7.9}$$

where ψ is said to be *even* if $\psi(-1_{\mathbb{F}_q}) = 1_{\mathbb{C}}$, and *odd* otherwise.

2.8. Parameter sets for $\text{Irr} H_n$

Here, we take up again the notation introduced at the beginning of Section 2.2. Given a partition $\lambda \in \mathcal{P}_n$, we will be able to associate to it three different characters: the unipotent character χ_{λ}^G of G described in Remark 2.7.5, which we will see below is, in fact, an element of $\text{Irr}(G : \mathbb{B})$; a character $\chi_{\lambda}^{\mathcal{H}} \in \text{Irr} \mathcal{H}(G, \mathbb{B})$; and the irreducible character $\chi_{\lambda}^{\mathfrak{S}}$ of the symmetric group \mathfrak{S}_n . The discussions in Sections 2.2 and 2.6 suggest that there are relationships amongst these, and the purpose of this section is indeed to clarify this.

To a partition $\nu \in \mathcal{P}_n$, say $\nu = (\nu_1, \dots, \nu_{\ell})$, one can associate a subgroup $\mathfrak{S}_{\nu} := \mathfrak{S}_{\nu_1} \times \dots \times \mathfrak{S}_{\nu_{\ell}} \leq \mathfrak{S}_n$ and then consider the character $\tau_{\nu}^{\mathfrak{S}}$ of the induced representation

$\text{Ind}_{\mathfrak{S}_v}^{\mathfrak{S}_n} \mathbb{1}_{\mathfrak{S}_v}$. Then these characters are related to those of the irreducible representations $\chi_\lambda^{\mathfrak{S}}$ (see Section 2.7.1) by the Kostka numbers $K_{\lambda v}$ [FH, Corollary 4.39], via the relationship

$$\tau_v^{\mathfrak{S}} = \sum_{\lambda \in \mathcal{P}_n} K_{\lambda v} \chi_\lambda^{\mathfrak{S}}. \tag{2.8.1}$$

Also to $v \in \mathcal{P}_n$ one can associate a standard parabolic subgroup $P_v \leq G$ whose Levi factor L_v is isomorphic to $\text{GL}_{v_1}(\mathbb{F}_1) \times \cdots \times \text{GL}_{v_\ell}(\mathbb{F}_q)$. Then one may consider the character $\tau_v^G := \text{Ind}_{P_v}^G \mathbb{1}_{P_v}$ of the parabolic induction of the trivial representation.²

Then if $\lambda \in \mathcal{P}_n$ and χ_λ^G denotes the corresponding unipotent characters (as described in Remark 2.7.5), the following remarkable parallel with representations of the symmetric group was already observed in [Ste, Corollary 1]:

$$\tau_v^G = \sum_{\lambda \in \mathcal{P}_n} K_{\lambda v} \chi_\lambda^G. \tag{2.8.2}$$

In particular, as $K_{\lambda\lambda} = 1$ for all $\lambda \in \mathcal{P}_n$, we see that χ_λ^G is a component of τ_λ^G and hence of $\tau_{(1^n)}^G$, which is the character of $\text{Ind}_B^G \mathbb{1}_B$. This shows that

$$\{\chi_\lambda^G : \lambda \in \mathcal{P}_n\} \subseteq \text{Irr}(G : B). \tag{2.8.3}$$

Now consider the specializations (2.2.1) of H_n corresponding to $\theta_q, \theta_1 : \mathbb{C}[u^{\pm 1}] \rightarrow \mathbb{C}$. Since $H_n(u)$ is split semisimple [CR, (68.12) Corollary], Tits’s deformation theorem ([CR, (68.20) Corollary], [GP, 7.4.6 Theorem]) applies to give bijections

$$d_{\theta_q} : \text{Irr } H_n(u) \xrightarrow{\sim} \text{Irr } H_n(q) = \text{Irr } \mathcal{H}(G, B), \quad d_{\theta_1} : \text{Irr } H_n(u) \xrightarrow{\sim} \text{Irr } H_n(1) = \text{Irr } \mathfrak{S}_n,$$

where a character $\mathcal{X} : H_n \rightarrow \mathbb{C}[u^{\pm 1}]$ (the characters of $H_n(u)$ are in fact defined over $\mathbb{C}[u^{\pm 1}]$ by [GP, Proposition 7.3.8]) is taken to its specialization $\mathcal{X}_z : H_n \rightarrow \mathbb{C} \otimes_{\theta_z} \mathbb{C}[u^{\pm 1}] = \mathbb{C}$ for $z = 1$ or $z = q$. We can thus define the composition

$$\mathbf{T}_B := d_{\theta_q} \circ d_{\theta_1}^{-1} : \text{Irr } \mathfrak{S}_n \xrightarrow{\sim} \text{Irr } \mathcal{H}(G, B). \tag{2.8.4}$$

Now, we have bijections (using Proposition 2.6.3 for the one on the left)

$$\begin{array}{ccc} \text{Irr}(G : B) & & \text{Irr } \mathfrak{S}_n \\ & \searrow \mathbf{D}_B & \swarrow \mathbf{T}_B \\ & \text{Irr } \mathcal{H}(G, B) & \end{array} \tag{2.8.5}$$

and since $|\text{Irr } \mathfrak{S}_n| = |\mathcal{P}_n|$ all of the sets are of this size, so the inclusion in (2.8.3) is in fact an equality

$$\text{Irr}(G : B) = \{\chi_\lambda^G : \lambda \in \mathcal{P}_n\}.$$

Furthermore, the following holds.

² By [DM, Proposition 6.1], τ_v^G depends only on the isomorphism class of L_v (rather than the parabolic P_v), which in turn depends only on v .

Proposition 2.8.6 ([HR, Theorem 4.9(b)]). *For $\lambda \in \mathcal{P}_n$, one has*

$$\mathbf{D}_B(\chi_\lambda^G) = \mathbf{T}_B(\chi_\lambda^\mathfrak{S}).$$

Proof. [CR, (68.24) Theorem] states that the bijection $\mathbf{D}_B^{-1} \circ \mathbf{T}_B : \text{Irr } \mathfrak{S}_n \xrightarrow{\sim} \text{Irr}(G : B)$ satisfies

$$((\mathbf{D}_B^{-1} \circ \mathbf{T}_B)(\chi_\lambda^\mathfrak{S}), \tau_\nu^G) = (\chi_\lambda^\mathfrak{S}, \tau_\nu^\mathfrak{S})$$

for all $\nu \in \mathcal{P}_n$. Since the right hand side is, from (2.8.1), $K_{\lambda\nu}$, formula (2.8.2) implies that we must have $\mathbf{D}_B^{-1} \circ \mathbf{T}_B(\chi_\lambda^\mathfrak{S}) = \chi_\lambda^G$. \square

This allows us to unambiguously define, for each $\lambda \in \mathcal{P}_n$, an irreducible representation $\chi_\lambda^{\mathcal{H}} \in \text{Irr } \mathcal{H}(G, B)$ by

$$\chi_\lambda^{\mathcal{H}} := \mathbf{D}_B(\chi_\lambda^G) = \mathbf{T}_B(\chi_\lambda^\mathfrak{S}).$$

2.9. *Parameter sets for $\text{Irr } Y_{d,n}$*

In Section 2.7, we saw that the set \mathcal{Q}_n was used to parametrize both the irreducible representations of $\text{Irr } N$ (Section 2.7.2) and a subset of those of $G = \text{GL}_n(\mathbb{F}_q)$ (Remark 2.7.5). We will see (in Remark 2.9.20) that the latter subset is in fact $\text{Irr}(G : U)$, which by Proposition 2.6.3 yields the irreducible representations of $\mathcal{H}(G, U)$, and furthermore that Tits’s deformation theorem again applies to the generic Yokonuma–Hecke algebra, which gives a bijection of these representations with $\text{Irr } N$. The purpose of this section is to establish, as in Section 2.8, the precise correspondence between the relevant irreducible representations in terms of the elements of the parameter set \mathcal{Q}_n .

Let us proceed with the argument involving Tits’s deformation theorem. Recall from Theorem 2.4.3 that we have isomorphisms

$$\mathcal{H}(G, U) \cong Y_{q-1,n}(q) \quad \text{and} \quad \mathbb{C}[N] \cong Y_{q-1,n}(1)$$

by specializing $Y_{q-1,n}$ at $u = q$ and $u = 1$, respectively. Thus, both $\mathcal{H}(G, U) \cong Y_{q-1,n}(q)$ and $\mathbb{C}[N] \cong Y_{q-1,n}(1)$ are split semisimple by [CPA, Proposition 9], and $Y_{d,n}(u)$ is also split by [CPA, 5.2].³ Thus, the deformation theorem ([CR, (68.20) Corollary], [GP, 7.4.6 Theorem]) again applies to yield bijections

$$\begin{aligned} d_{\theta_q} : \text{Irr } Y_{q-1,n}(u) &\xrightarrow{\sim} \text{Irr } Y_{q-1,n}(q) = \text{Irr } \mathcal{H}(G, U), \\ d_{\theta_1} : \text{Irr } Y_{q-1,n}(u) &\xrightarrow{\sim} \text{Irr } Y_{q-1,n}(1) = \text{Irr } N, \end{aligned} \tag{2.9.1}$$

where we denote by $\theta_q : \mathbb{C}[u^{\pm 1}] \rightarrow \mathbb{C}$ the \mathbb{C} -algebra homomorphism sending u to q . Again, [GP, Proposition 7.3.8] applies to show that if $\mathcal{X} \in \text{Irr } Y_{d,n}(u)$, then in fact \mathcal{X}

³ Strictly speaking, [CPA] considers $Y_{d,n}(v)$ where $v^2 = u$. However, one can define all irreducible representations in [CPA, Proposition 5] of $Y_{d,n}(v)$ already over $Y_{d,n}(u)$ by a slight change in the defining formulas of [CPA, Proposition 5] (see [CPo, Theorem 3.7]).

maps $Y_{d,n}$ into $\mathbb{C}[u^{\pm 1}]$, and the bijections in (2.9.1) are in fact the specializations of \mathcal{X} . We may put these together to obtain a bijection

$$\mathbf{T}_U := d_{\theta_q} \circ d_{\theta_1}^{-1} : \text{Irr } \mathbb{N} \rightarrow \text{Irr } \mathcal{H}(G, U). \tag{2.9.2}$$

Furthermore, [GP, Remark 7.4.4] tells us that

$$d_{\theta_q}(\mathcal{X}) = \theta_q(\mathcal{X}) \quad \text{and} \quad d_{\theta_1}(\mathcal{X}) = \theta_1(\mathcal{X}). \tag{2.9.3}$$

In particular, the dimensions of the irreducible representations of $\mathcal{H}(G, U)$ and $\mathbb{C}[\mathbb{N}]$ agree. Thus, we may conclude from Wedderburn’s theorem that the Hecke algebra $\mathcal{H}(G, U)$ and the group algebra $\mathbb{C}[\mathbb{N}]$ are isomorphic as abstract \mathbb{C} -algebras.

Defining $\mathbf{D}_U : \text{Irr}(G : U) \rightarrow \text{Irr } \mathcal{H}(G, U)$ as in Proposition 2.6.3, we get a diagram like that at (2.8.5):

$$\begin{array}{ccc} \text{Irr}(G : U) & & \text{Irr } \mathbb{N} \\ & \searrow \mathbf{D}_U & \swarrow \mathbf{T}_U \\ & \text{Irr } \mathcal{H}(G, U) & \end{array} \tag{2.9.4}$$

For every $\Lambda \in \mathcal{Q}_n$ we will define a character $\chi_\Lambda^Y \in \text{Irr } Y_{d,n}(u)$ (see (2.9.24) in Section 2.9.4 below) such that

$$\chi_\Lambda^Y \otimes_{\theta_1} \mathbb{C} = d_{\theta_1}(\chi_\Lambda^Y) = \chi_\Lambda^N \in \text{Irr } \mathbb{N}$$

is the one described in Section 2.7.2 for the modified $\tilde{\Lambda}$. This together with the $u = q$ specialization

$$\chi_\Lambda^Y \otimes_{\theta_q} \mathbb{C} = d_{\theta_q}(\chi_\Lambda^Y) = \chi_\Lambda^{\mathcal{H}} \in \text{Irr } \mathcal{H}(G, U)$$

will satisfy

$$\mathbf{T}_U(\chi_\Lambda^N) = \chi_\Lambda^{\mathcal{H}}.$$

As in Section 2.6, for a character $\chi_\Lambda^G \in \text{Irr}(G : U)$ one defines

$$\mathbf{D}_U(\chi_\Lambda^G) := \text{Hom}_U(\mathbb{1}_U, \text{Res}_U^G \chi_\Lambda^G),$$

namely, the subspace of U -invariants, as in Proposition 2.6.3.

Our definition of χ_Λ^Y will be such that the χ_Λ^G from Section 2.7.1 is mapped by \mathbf{D}_U to the same $\chi_\Lambda^{\mathcal{H}}$, thus proving the main result of this section.

Theorem 2.9.5. *Let the characters χ_Λ^G and χ_Λ^N be those described in Sections 2.7.1 and 2.7.2, respectively. Then the set \mathcal{Q}_n parametrizes the pairs of irreducible representations (V, V^U) from Proposition 2.6.3 in such a way that the characters*

$$\chi_\Lambda^G \in \text{Irr}(G : U) \quad \text{and} \quad \chi_\Lambda^N \in \text{Irr } \mathbb{N}$$

satisfy

$$\mathbf{D}_U(\chi_\Lambda^G) = \mathbf{T}_U(\chi_\Lambda^N) \in \text{Irr } \mathcal{H}(G, U).$$

Inspired by the construction of $\text{Irr } N$ in Section 2.7.2, we establish a parallel with the technique of parabolic induction to build the character table of G using the unipotent characters as building blocks.

The rest of this section is devoted to studying the bijections \mathbf{D}_U , \mathbf{T}_U , \mathbf{D}_B and \mathbf{T}_B more carefully. In Section 2.9.1 we prove the compatibility between them. In Section 2.9.2 we analyze their behaviour under a twist by a degree one character. In Section 2.9.3 we check their interplay with parabolic induction and exterior tensor products. Finally, in Section 2.9.4 we construct the character table of the generic Yokonuma–Hecke algebra, as a common lift of both $\text{Irr } N$ and $\text{Irr}(G : U)$.

2.9.1. *From B to U.* Let us start by checking that the correspondence for the unipotent characters χ_λ^G in the $\mathcal{H}(G, U)$ -case agrees with the one in the $\mathcal{H}(G, B)$ -case (cf. Remark 2.7.5). Taking $G = G$, $H = B$, $K = U$ and $L = T$ in Proposition 2.1.12, noting that Lemma 2.1.11 applies as the set N of double U -coset representatives normalizes T , we get a surjective homomorphism $\mathcal{H}(G, U) \twoheadrightarrow \mathcal{H}(G, B)$, and hence we obtain an inflation map $\text{Infl} : \text{Rep } \mathcal{H}(G, B) \rightarrow \text{Rep } \mathcal{H}(G, U)$, taking $\text{Irr } \mathcal{H}(G, B)$ to $\text{Irr } \mathcal{H}(G, U)$. We can then make the following precise statement.

Proposition 2.9.6. *The following diagram is commutative:*

$$\begin{array}{ccccc}
 \text{Irr}(G : B) & \xrightarrow{\mathbf{D}_B} & \text{Irr } \mathcal{H}(G, B) & \xleftarrow{\mathbf{T}_B} & \text{Irr } \mathfrak{S}_n \\
 \downarrow & & \downarrow \text{Infl} & & \downarrow \text{Infl} \\
 \text{Irr}(G : U) & \xrightarrow{\mathbf{D}_U} & \text{Irr } \mathcal{H}(G, U) & \xleftarrow{\mathbf{T}_U} & \text{Irr } N
 \end{array} \tag{2.9.7}$$

where the top horizontal arrows are the bijections in (2.8.5), the bottom horizontal arrows those in (2.9.4), the leftmost vertical arrow is the natural inclusion and the other two are the inflation maps.

Proof. We know from Proposition 2.6.3 that \mathbf{D}_B maps χ_λ^G to the character $\chi_\lambda^{\mathcal{H}} \in \text{Irr } \mathcal{H}(G, B)$ given by

$$\chi_\lambda^{\mathcal{H}} = \text{Hom}_B(\mathbb{1}_B, \text{Res}_B^G \chi_\lambda^G) = \text{Hom}_G(\text{Ind}_B^G \mathbb{1}_B, \chi_\lambda^G).$$

We want to replace $\text{Ind}_B^G \mathbb{1}_B$ by $\text{Ind}_U^G \mathbb{1}_U$. Let us take a closer look at the latter. It is canonically isomorphic to $\text{Ind}_B^G \text{Ind}_U^B \mathbb{1}_U$, but since $B = U \rtimes T$, we have $\text{Ind}_U^B \mathbb{1}_U = \text{Infl}_T^B \mathbb{C}[T]$, where $\mathbb{C}[T]$ is the regular representation of T . Since $\mathbb{C}[T]$ is the direct sum of the degree one characters $\phi : T \rightarrow \mathbb{C}^\times$, the group of which we denote by \widehat{T} , one finds that $\text{Infl}_T^B \mathbb{C}[T]$ is the sum of the inflations $\phi : B \rightarrow \mathbb{C}^\times$, hence

$$\text{Ind}_U^G \mathbb{1}_U = \bigoplus_{\phi \in \widehat{T}} \text{Ind}_B^G \phi,$$

and

$$\text{Hom}_G(\text{Ind}_U^G \mathbb{1}_U, \chi_\lambda^G) = \bigoplus_{\phi \in \widehat{T}} \text{Hom}_G(\text{Ind}_B^G \phi, \chi_\lambda^G). \tag{2.9.8}$$

For any $\phi \in \widehat{T}$ one has

$$\text{Hom}_G(\text{Ind}_B^G \phi, \text{Ind}_B^G \mathbb{1}_B) = \text{Hom}_B(\phi, \text{Res}_B^G \text{Ind}_B^G \mathbb{1}_B),$$

which by the Mackey decomposition becomes

$$\begin{aligned} \sum_{\sigma \in B \backslash G/B} \text{Hom}_B(\phi, \text{Ind}_{B \cap \sigma^{-1} B \sigma}^B (\mathbb{1}_{B \cap \sigma^{-1} B \sigma})) \\ = \sum_{\sigma \in B \backslash G/B} \text{Hom}_{B \cap \sigma^{-1} B \sigma}(\text{Res}_{B \cap \sigma^{-1} B \sigma}^B \phi, \mathbb{1}_{B \cap \sigma^{-1} B \sigma}) \end{aligned}$$

where σ runs over a full set of B -double coset representatives. Since $T \subseteq B \cap \sigma^{-1} B \sigma$ acts non-trivially on $\text{Res}_{B \cap \sigma^{-1} B \sigma}^B(\phi)$ for ϕ non-trivial, the only non-vanishing term in this last sum is the one with $\phi = \mathbb{1}_B$.

Since χ_λ^G is a constituent of $\text{Ind}_B^G \mathbb{1}_B$, only one summand on the right hand side of (2.9.8) does not vanish and we end up with

$$\text{Hom}_G(\text{Ind}_U^G \mathbb{1}_U, \chi_\lambda^G) = \text{Hom}_G(\text{Ind}_B^G \mathbb{1}_B, \chi_\lambda^G).$$

The irreducible $\mathcal{H}(G, U)$ -representation associated to χ_λ^G is

$$\text{Hom}_U(\mathbb{1}_U, \text{Res}_U^G \chi_\lambda^G) = \text{Hom}_G(\text{Ind}_U^G \mathbb{1}_U, \chi_\lambda^G),$$

which is thus isomorphic to $\text{Hom}_G(\text{Ind}_B^G \mathbb{1}_B, \chi_\lambda^G)$ with the $\mathcal{H}(G, U)$ -module structure induced by the surjection $\mathcal{H}(G, U) \rightarrow \mathcal{H}(G, B)$ coming from Proposition 2.1.12. This proves the commutativity of the left square in (2.9.7).

The right one is also commutative since all the non-horizontal arrows in

arise from taking tensor products. □

2.9.2. *Twisting by characters of \mathbb{F}_q^\times .* In order to deal with character twists, we extend the Iwahori–Hecke algebra as follows. For $d, n \geq 1$ we introduce the $\mathbb{C}[u^{\pm 1}]$ -algebra $H_{d,n}$ defined by

$$H_{d,n} := H_n[h]/(h^d - 1) = H_n \otimes_{\mathbb{C}} \mathbb{C}[C_d]$$

where C_d is the cyclic group of order d and $h \in C_d$ a generator. As usual, denote by $H_{d,n}(u)$ the corresponding $\mathbb{C}(u)$ -algebra $\mathbb{C}(u) \otimes_{\mathbb{C}[u^{\pm 1}]} H_{d,n}$.

Since $H_{d,n}(u)$ is a tensor product of semisimple algebras it is also semisimple and its set of characters is the cartesian product of those of its factors. Concretely, for $\lambda \in \mathcal{P}_n$ and $\psi \in \text{Irr } \mathbb{C}[C_d]$ we define $\mathcal{X}_{\lambda, \psi}^{H_{d,n}}$ to be the exterior tensor product

$$\mathcal{X}_{\lambda, \psi}^{H_{d,n}} := \mathcal{X}_{\lambda}^{H_n} \otimes \psi \in \text{Irr } H_{d,n}(u) = \text{Irr } H_n(u) \times \text{Irr } \mathbb{C}[C_d]. \quad (2.9.9)$$

These are all the irreducible representations of $H_{d,n}(u)$, and they all come from localizing certain finitely generated representations of $H_{d,n}$ that we also denote by $\mathcal{X}_{\lambda, \psi}^{H_{d,n}}$.

There is a natural quotient

$$Y_{d,n} \twoheadrightarrow H_{d,n} \quad (2.9.10)$$

that sends the $h_i \in Y_{d,n}$ to $h \in H_{d,n}$ and the $T_i \in Y_{d,n}$ to the T_i from H_n .

The $u = 1$ specialization gives

$$\mathbb{C} \otimes_{\theta_1} H_{d,n} \simeq \mathbb{C}[\mathfrak{S}_n] \otimes_{\mathbb{C}} \mathbb{C}[C_d] = \mathbb{C}[\mathfrak{S}_n \times C_d],$$

and the $u = q$ specialization gives

$$\mathbb{C} \otimes_{\theta_q} H_{d,n} \simeq \mathcal{H}(G, B) \otimes_{\mathbb{C}} \mathbb{C}[C_d],$$

which in the $d = q - 1$ case gives

$$\mathcal{H}(G, B)[\mathbb{F}_q^\times] \simeq \mathcal{H}(G, B_1) \quad \text{where} \quad B_1 = B \cap \text{SL}_n(\mathbb{F}_q).$$

Here

$$\text{Irr } \mathcal{H}(G, B_1) = \text{Irr } \mathcal{H}(G, B) \times \text{Irr } \mathbb{F}_q^\times$$

and the $u = q$ specialization of the natural map (2.9.10) becomes

$$\mathcal{H}(G, U) \twoheadrightarrow \mathcal{H}(G, B)[\mathbb{F}_q^\times] \quad (2.9.11)$$

where, for $\sigma \in \mathfrak{S}_n$ and $t \in T$, the corresponding basis elements are mapped as follows:

$$\begin{aligned} \mathcal{H}(G, U) \ni T_\sigma &\mapsto T_\sigma \in \mathcal{H}(G, B), \\ \mathcal{H}(G, U) \ni T_t &\mapsto \det t \in \mathbb{F}_q^\times \subseteq \mathcal{H}(G, B)[\mathbb{F}_q^\times]. \end{aligned}$$

Remark 2.9.12. The T_i from $Y_{q-1,n}$ corresponds to $\omega_i \in T \rtimes \mathfrak{S}_n$, whereas the T_i from $H_{q-1,n}$ corresponds to $\sigma_i \in \mathfrak{S}_n \subseteq \mathbb{F}_q^\times \times \mathfrak{S}_n$. Therefore, the $u = 1$ specialization of (2.9.10) gives the surjection

$$T \rtimes \mathfrak{S}_n \twoheadrightarrow \mathbb{F}_q^\times \times \mathfrak{S}_n, \quad T \rtimes \mathfrak{S}_n \ni (t, \sigma) \mapsto ((\det t)(\operatorname{sgn} \sigma), \sigma) \in \mathbb{F}_q^\times \times \mathfrak{S}_n, \quad (2.9.13)$$

where $\operatorname{sgn} \sigma = (-1)^{\ell(\sigma)} \in \mathbb{F}_q^\times$. For this reason we define

$$\widetilde{\operatorname{Infl}} : \operatorname{Irr}(\mathfrak{S}_n \times \mathbb{F}_q^\times) \rightarrow \operatorname{Irr} N$$

as composition with the map (2.9.13). Thus, for $\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}} := \chi_\lambda^{\mathfrak{S}} \otimes \psi \in \operatorname{Irr}(\mathbb{F}_q^\times \times \mathfrak{S}_n)$ and $(t, \sigma) \in N$, we have

$$\widetilde{\operatorname{Infl}}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(t, \sigma) = \psi((\operatorname{sgn} \sigma)(\det t)) \chi_\lambda^{\mathfrak{S}}(\sigma). \quad (2.9.14)$$

Remark 2.9.15. In general, we reserve the notation Infl for inflation by the natural quotient. In this case it is

$$T \rtimes \mathfrak{S}_n \twoheadrightarrow \mathbb{F}_q^\times \times \mathfrak{S}_n$$

mapping $(t, \sigma) \in T \rtimes \mathfrak{S}_n$ to $(\det t, \sigma)$. Therefore, by (2.9.14),

$$\widetilde{\operatorname{Infl}}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(t, \sigma) = \psi(\operatorname{sgn} \sigma) \operatorname{Infl}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(t, \sigma).$$

Since $\psi \circ \operatorname{sgn} \in \operatorname{Irr} \mathfrak{S}_n$ is the sign representation when ψ is an odd (i.e., non-square) character, and is trivial when ψ is even (i.e., the square of a character), and tensoring with the sign representation amounts to taking the transpose partition λ' , we see that

$$\widetilde{\operatorname{Infl}}(\chi_{\lambda, \psi}) = \begin{cases} \operatorname{Infl}(\chi_{\lambda', \psi}) & \text{for } \psi \text{ odd,} \\ \operatorname{Infl}(\chi_{\lambda, \psi}) & \text{for } \psi \text{ even,} \end{cases}$$

where the superscripts $\mathbb{F}_q^\times \mathfrak{S}$ have been omitted.

Remark 2.9.16. In any case we have

$$\widetilde{\operatorname{Infl}}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(t) = \psi(\det t) \chi_\lambda^{\mathfrak{S}}(1) = \operatorname{Infl}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(t)$$

for $t \in T \subseteq N$, and

$$\widetilde{\operatorname{Infl}}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(\omega_i) = \chi_\lambda^{\mathfrak{S}}(s_i) = \operatorname{Infl}(\chi_{\lambda, \psi}^{\mathbb{F}_q^\times \mathfrak{S}})(s_i)$$

where $\omega_i, s_i \in N$ as in Theorem 2.4.3. Thus, by definition of the characters $\chi_\Lambda^N \in \operatorname{Irr} \mathbb{Z}_{\geq 0}$ for $\Lambda \in \mathcal{Q}_n$ in Section 2.7.2 and (2.7.9),

$$\chi_\Lambda^N(t) = \chi_\Lambda^N(t) \quad \text{and} \quad \chi_\Lambda^N(\omega_i) = \chi_\Lambda^N(s_i) \quad (2.9.17)$$

for $\Lambda \in \mathcal{Q}_n, t \in T$, and $\omega_i, s_i \in N$ as before.

Let $\chi_\lambda^G \in \text{Irr}(G : B) \subseteq \text{Irr}(G : U)$ be a unipotent character and let $\psi \in \Gamma_1 = \widehat{\mathbb{F}_q^\times}$. As in Remark 2.7.5, we have $\psi^G := \psi \circ \det : G \rightarrow \mathbb{C}^\times$ and we consider the representation $\chi_\lambda^G \otimes \psi^G$. Since $U \subseteq \ker \psi^G$, we have $\dim (\chi_\lambda^G \otimes \psi^G)^U = \dim (\chi_\lambda^G)^U > 0$, so $\chi_\lambda^G \otimes \psi^G \in \text{Irr}(G : U)$. Thus, taking tensor products gives a map $\text{Irr}(G : B) \times \widehat{\mathbb{F}_q^\times} \rightarrow \text{Irr}(G : U)$.

Proposition 2.9.18. *Let $\psi \in \Gamma_1$ be as above. Then the following diagram is commutative:*

$$\begin{array}{ccccc}
 \text{Irr}(G : B) & \xrightarrow{\mathbf{D}_B} & \text{Irr } \mathcal{H}(G, B) & \xleftarrow{\mathbf{T}_B} & \text{Irr } \mathfrak{S}_n \\
 \downarrow -\otimes \psi & & \downarrow -\otimes \psi & & \downarrow -\otimes \psi \\
 \text{Irr}(G : B) \times \widehat{\mathbb{F}_q^\times} & \xrightarrow{(\mathbf{D}_B, \text{id})} & \text{Irr}(\mathcal{H}(G, B)[\mathbb{F}_q^\times]) & \xleftarrow{(\mathbf{T}_B, \text{id})} & \text{Irr}(\mathfrak{S}_n \times \mathbb{F}_q^\times) \\
 \downarrow -\otimes - & & \downarrow \text{Infl} & & \downarrow \widetilde{\text{Infl}} \\
 \text{Irr}(G : U) & \xrightarrow{\mathbf{D}_U} & \text{Irr } \mathcal{H}(G, U) & \xleftarrow{\mathbf{T}_U} & \text{Irr } N
 \end{array}$$

Proof. The commutativity of the squares on the left largely comes from the formula (2.6.1) for the action of the Hecke algebra, as well as noting that the $\mathcal{H}(G, U)$ -action factors through the surjection onto $\mathcal{H}(G, B)[\mathbb{F}_q^\times] = \mathcal{H}(G, B_1)$, which comes from either (2.9.11) or Proposition 2.1.12.

The squares on the right are also commutative since all the non-horizontal arrows in

$$\begin{array}{ccccc}
 & & \text{Irr } H_n(u) & & \\
 & \swarrow d_{\theta_q} & \downarrow & \searrow d_{\theta_1} & \\
 \text{Irr } \mathcal{H}(G, B) & \xleftarrow{\mathbf{T}_B} & & \xrightarrow{\mathbf{T}_B} & \text{Irr } \mathfrak{S}_n \\
 \downarrow -\otimes \psi & & \downarrow -\otimes \psi & & \downarrow -\otimes \psi \\
 & & \text{Irr}(H_n(u)[\mathbb{F}_q^\times]) & & \\
 \downarrow d_{\theta_q} & & \downarrow d_{\theta_1} & & \\
 \text{Irr}(\mathcal{H}(G, B)[\mathbb{F}_q^\times]) & \xleftarrow{(\mathbf{T}_B, \text{id})} & & \xrightarrow{(\mathbf{T}_B, \text{id})} & \text{Irr}(\mathfrak{S}_n \times \mathbb{F}_q^\times) \\
 \downarrow \text{Infl} & & \downarrow \text{Infl} & & \downarrow \widetilde{\text{Infl}} \\
 & & \text{Irr } Y_n(u) & & \\
 \downarrow d_{\theta_q} & & \downarrow d_{\theta_1} & & \\
 \text{Irr } \mathcal{H}(G, U) & \xleftarrow{\mathbf{T}_U} & & \xrightarrow{\mathbf{T}_U} & \text{Irr } N
 \end{array}$$

arise from tensor products. □

2.9.3. Parabolic induction. We now check that the parabolic induction of a product of irreducible representations is compatible with the operations \mathbf{D}_U (coming from Section 2.6) and \mathbf{T}_U (defined at (2.9.2)).

Suppose n_1, n_2 are such that $n = n_1 + n_2$. For $i = 1, 2$, let $G_i := GL_{n_i}(\mathbb{F}_q)$, and let B_i, U_i , and N_i be the respective subgroups of G_i as described at the beginning of Section 2.3. Let $L = G_1 \times G_2$ and view it as the subgroup of $G = GL_n(\mathbb{F}_q)$ of block diagonal matrices; let $U_{12} \leq G$ be the subgroup of upper block unipotent matrices and $P := LU_{12}$ the corresponding parabolic subgroup. If $B_L := L \cap B$, then its unipotent radical is $U_L = L \cap U = U_1 \times U_2$. One may also identify $N_1 \times N_2$ with a (proper) subgroup of N .

Remark 2.9.19. Observe that $U = U_L \rtimes U_{12}$ and L normalizes U_{12} , so that, with $G = G$, $H = U$, $L = L$, $K = U_L$ and $U = U_{12}$, we are in the situation of Section 2.1.2, and Proposition 2.1.14 gives an inclusion $\mathcal{H}(L, U_L) \hookrightarrow \mathcal{H}(G, U)$. Furthermore, the functor $R_L^G : \text{Rep } L \rightarrow \text{Rep } G$ defined at (2.6.6) is the usual parabolic induction functor.

Remark 2.9.20. For $i = 1, 2$, let $\psi_1, \psi_2 \in \widehat{\mathbb{F}_q^\times}$ be distinct and let $\lambda_i \in \mathcal{P}_{n_i}$. Then by the discussion preceding Proposition 2.9.18, $\chi_{\lambda_i}^G \otimes \psi_i^{G_i} \in \text{Irr}(G_i : U_i)$. Thus, Remark 2.9.19 makes the discussion preceding Proposition 2.6.7 relevant: it says that $(\chi_{\lambda_1}^G \otimes \psi_1^{G_1}) \circ (\chi_{\lambda_2}^G \otimes \psi_2^{G_2}) \in \text{Rep}(G : U)$. However, this \circ -product is irreducible, as mentioned in Remark 2.7.5, so in fact it lies in $\text{Irr}(G : U)$. By a straightforward inductive argument, we see that for every $\Lambda \in \mathcal{Q}_n$, one has $\chi_\Lambda^G \in \text{Irr}(G : U)$ (as defined in Remark 2.7.5). We repeat the argument of Section 2.8 to show that $\text{Irr}(B : G)$ consists of precisely the unipotent representations: one has an inclusion

$$\{\chi_\Lambda^G : \Lambda \in \mathcal{Q}_n\} \subseteq \text{Irr}(G : U),$$

but since $|\text{Irr}(G : U)| = |\text{Irr } \mathcal{H}(G, U)| = |\text{Irr } N| = |\mathcal{Q}_n|$ via the bijections \mathbf{D}_U and \mathbf{T}_U , we must have equality.

Remark 2.9.21. Since

$$\begin{aligned} \text{Hom}_{U_L}(\mathbb{1}_{U_L}, \text{Res}_{U_L}^L(\chi_1^{G_1} \otimes \chi_2^{G_2})) \\ \cong \text{Hom}_{U_1}(\mathbb{1}_{U_1}, \text{Res}_{U_1}^{G_1} \chi_1^{G_1}) \otimes_{\mathbb{C}} \text{Hom}_{U_2}(\mathbb{1}_{U_2}, \text{Res}_{U_2}^{G_2} \chi_2^{G_2}) \end{aligned}$$

as modules over the algebra $\mathcal{H}(L, U_L) \cong \mathcal{H}(G_1, U_1) \otimes \mathcal{H}(G_2, U_2)$, one has

$$\mathbf{D}_{U_L}(\chi_1^{G_1} \otimes \chi_2^{G_2}) \cong \mathbf{D}_{U_1}(\chi_1^{G_1}) \otimes \mathbf{D}_{U_2}(\chi_2^{G_2}). \tag{2.9.22}$$

Proposition 2.9.23. *The following diagram is commutative:*

$$\begin{array}{ccccc} \text{Irr}(G_1 : U_1) \times \text{Irr}(G_2 : U_2) & \xrightarrow{\mathbf{D}_{U_L}} & \text{Irr } \mathcal{H}(L, U_L) & \xleftarrow{\mathbf{T}_{U_L}} & \text{Irr}(N_1 \times N_2) \\ \downarrow \text{---} & & \downarrow \text{Ind} & & \downarrow \text{Ind} \\ \text{Rep}(G : U) & \xrightarrow{\mathbf{D}_U} & \text{Rep } \mathcal{H}(G, U) & \xleftarrow{\mathbf{T}_U} & \text{Rep } N \end{array}$$

Proof. Commutativity of the left square comes from Proposition 2.6.7, which applies by Remark 2.9.19 and by observing that $\bigcap_{\ell \in L} \ell U_L \ell^{-1}$ is trivial.

Let us take representations $\mathcal{X}_1^Y, \mathcal{X}_2^Y$ of $Y_{q-1,n_1}(u)$ and $Y_{q-1,n_2}(u)$ and denote their corresponding $u = 1$ specializations by $\chi_1^{N_1}$ and $\chi_2^{N_2}$, and their $u = q$ specializations by $\chi_1^{\mathcal{H}_1}$ and $\chi_2^{\mathcal{H}_2}$, respectively, so that

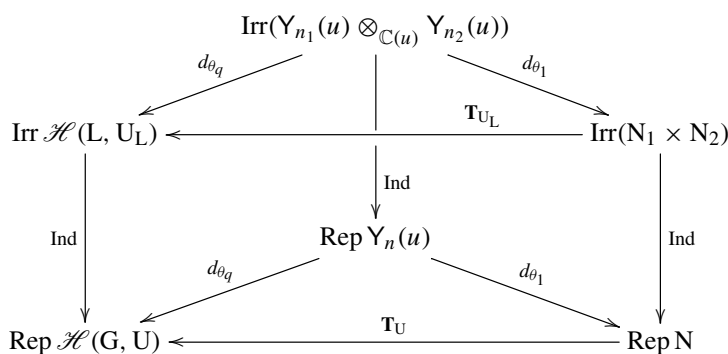

$$\mathbf{T}_{U_i}(\chi_i^{N_i}) = \chi_i^{\mathcal{H}_i}.$$

For $i = 1, 2$ we write $\chi_i^{G_i}$ for the corresponding G_i representation, in such a way that $\chi_i^{\mathcal{H}_i}$ agrees with

$$\mathrm{Hom}_{U_i}(\mathbb{1}_{U_i}, \mathrm{Res}_{U_i}^{G_i} \chi_i^{G_i}),$$

namely, the $\mathcal{H}(G_i, U_i)$ -representation $\mathbf{D}_{U_i}(\chi_i^{G_i})$.

By (2.9.22), the commutativity of the right square follows since the vertical and diagonal arrows in

come from taking tensor products. Namely

$$\mathrm{Ind}_{\mathcal{H}(L, U_L)}^{\mathcal{H}(G, U)} \mathbf{T}_U(\chi_1^{N_1} \otimes \chi_2^{N_2}) = \mathcal{H}(G, U) \otimes_{\mathcal{H}(L, U_L)} (\chi_1^{\mathcal{H}_1} \otimes \chi_2^{\mathcal{H}_2})$$

happens to be the $u = q$ specialization of

$$Y_n \otimes_{Y_{n_1} \otimes Y_{n_2}} (\mathcal{X}_1^Y \otimes \mathcal{X}_2^Y).$$

Taking the $u = 1$ specialization gives

$$\mathbb{C}[N] \otimes_{\mathbb{C}[N_1 \times N_2]} (\chi_1^{N_1} \otimes \chi_2^{N_2}) = \mathrm{Ind}_{N_1 \times N_2}^N (\chi_1^{N_1} \otimes \chi_2^{N_2}),$$

thus proving

$$\mathrm{Ind}_{\mathcal{H}(L, U_L)}^{\mathcal{H}(G, U)} \mathbf{T}_{U_L}(\chi_1^{N_1} \otimes \chi_2^{N_2}) = \mathbf{T}_U(\mathrm{Ind}_{N_1 \times N_2}^N (\chi_1^{N_1} \otimes \chi_2^{N_2})). \quad \square$$

2.9.4. *Proof of Proposition 2.9.5.* We define a family of representations of $Y_{q-1,n}$ parametrized by \mathcal{Q}_n whose $u = 1$ specialization matches that of Section 2.7.2, and whose $u = q$ specialization gives the \mathbf{D}_U image of the characters described in Remark 2.7.5.

Given a partition $\lambda \vdash n$ and a character $\psi : \mathbb{F}_q^\times \rightarrow \mathbb{C}^\times$, let us define a representation $\mathcal{X}_{\lambda,\psi}^{Y_{q-1,n}}$ of $Y_{q-1,n}$ by inflating the $H_{q-1,n}$ -representation $\mathcal{X}_\lambda^{H_n} \otimes \psi$ from (2.9.9) via the natural quotient (2.9.10).

Now, for $\Lambda \in \mathcal{Q}_n$, let ψ_i, λ_i, n_i be as in the paragraph preceding (2.7.7) and consider the $\mathbb{C}[u^{\pm 1}]$ -algebra

$$Y_{(n_i)} := \bigotimes_i Y_{q-1,n_i}$$

which may be embedded in $Y_{q-1,n}$ by a choice of ordering of the indices i . This has the representation

$$\mathcal{X}_\Lambda^{Y_{(n_i)}} := \bigotimes_i \mathcal{X}_{\lambda_i,\psi_i}^{Y_{q-1,n_i}}$$

where the tensor is over $\mathbb{C}[u^{\pm 1}]$, and we may define \mathcal{X}_Λ^Y as the induced character

$$\mathcal{X}_\Lambda^Y := \text{Ind}_{Y_{(n_i)}}^{Y_{q-1,n}} \mathcal{X}_\Lambda^{Y_{(n_i)}}. \tag{2.9.24}$$

We are now in a position to prove Proposition 2.9.5.

Proof of Proposition 2.9.5. Take a $\Lambda \in \mathcal{Q}_n$ and the corresponding pairs (λ_i, ψ_i) with $\Lambda(\psi_i) = \lambda_i$, and define $n_i = |\lambda_i|$. Let us write $N_i = (\mathbb{F}_q^\times)^{n_i} \rtimes \mathfrak{S}_{n_i}$, $G_i = \text{GL}_{n_i}(\mathbb{F}_q)$, $L = \prod_i G_i$ viewed as the subgroup of block diagonal matrices of G , and U_L the product of the upper triangular unipotent subgroups.

Consider the $Y_{q-1,n}$ -representation \mathcal{X}_Λ^Y defined in (2.9.24). Its $u = 1$ and $u = q$ specializations give, by the commutativity of the squares on the right in Proposition 2.9.18,

$$\chi_\Lambda^N := \text{Ind}_{\prod_i N_i}^N \bigotimes_i \widetilde{\text{Infl}}(\chi_{\lambda_i}^{\mathfrak{S}_{n_i}} \otimes \psi_i) \quad \text{and} \quad \chi_\Lambda^{\mathcal{H}} := \text{Ind}_{\mathcal{H}(L,U_L)}^{\mathcal{H}(G,U)} \bigotimes_i \text{Infl}(\chi_{\lambda_i}^{H_{n_i}} \otimes \psi_i)$$

where we regard $\prod_i N_i$ as a subgroup of N embedded by the same choice of indices as for $Y_{(n_i)}$ in $Y_{q-1,n}$. Therefore,

$$\mathbf{T}_U(\chi_\Lambda^N) = \chi_\Lambda^{\mathcal{H}}. \tag{2.9.25}$$

The character $\chi_\Lambda^G \in \text{Irr}(G : U)$ was defined at (2.7.7). Applying \mathbf{D}_U , one gets, by Proposition 2.9.23 and an inductive argument,

$$\begin{aligned} \mathbf{D}_U(\chi_\Lambda^G) &= \text{Ind}_{\mathcal{H}(L,U_L)}^{\mathcal{H}(G,U)} \bigotimes_i \mathbf{D}_{U_i}(\chi_{\lambda_i}^{G_i} \otimes \psi_i) = \text{Ind}_{\mathcal{H}(L,U_L)}^{\mathcal{H}(G,U)} \bigotimes_i \mathbf{D}_{B_i}(\chi_{\lambda_i}^{G_i}) \otimes \psi_i \\ &= \text{Ind}_{\mathcal{H}(L,U_L)}^{\mathcal{H}(G,U)} \bigotimes_i \chi_{\lambda_i}^{H_{n_i}} \otimes \psi_i, \end{aligned}$$

where we have used Proposition 2.9.18 and Proposition 2.9.6 for the last two equalities. But this is exactly $\chi_\Lambda^{\mathcal{H}}$. So we may conclude by taking a second look at (2.9.25). \square

Remark 2.9.26. One can use this construction to give another proof of the splitting of $Y_{d,n}(u)$, together with a list of its irreducible representations parametrized by the set

$$\mathcal{Q}_{d,n} := \left\{ \Lambda : \widehat{C}_d \rightarrow \mathcal{P} : \sum_{\phi \in \widehat{C}_d} |\Lambda(\phi)| = n \right\}$$

where C_d is the cyclic group with d elements.

Given a function $\Lambda \in \mathcal{Q}_{d,n}$ we consider the set of pairs (ψ_i, λ_i) with $\Lambda(\psi_i) = \lambda_i$ and $n_i = |\lambda_i|$ adding up to n . Define

$$\mathcal{X}_\Lambda^{Y_{(n_i)}} := \bigotimes_i \mathcal{X}_{\lambda_i, \psi_i}^{Y_{d, n_i}}$$

for the $\mathbb{C}[u^{\pm 1}]$ -algebra $Y_{(n_i)} := \bigotimes_i Y_{d, n_i}$, where $\mathcal{X}_{\lambda, \psi}^{Y_{d, n}}$ stands for the inflation of the $\mathcal{X}_{\lambda, \psi}^{H_{d, n}}$ from (2.9.9).

The induced characters $\mathcal{X}_\Lambda^Y := \text{Ind}_{Y_{(n_i)}(u)}^{Y_{d, n}(u)} \mathcal{X}_\Lambda^{Y_{(n_i)}}$ are defined over $\mathbb{C}(u)$ since the $\mathcal{X}_\lambda^{H_n}$ are (cf. [BC, Theorem 2.9]). We extend scalars to some finite Galois extension $\mathbb{K}/\mathbb{C}(u)$ so that $Y_{d, n}$ becomes split. One can also extend the $u = 1$ specialization as in [GP, 8.1.6], and $\mathbb{K}Y_{d, n}$ becomes isomorphic to $\mathbb{K}[C_d^n \rtimes \mathfrak{S}_n]$, being a deformation of $\mathbb{C}[C_d^n \rtimes \mathfrak{S}_n]$. The specializations

$$\chi_\Lambda^{C_d^n \rtimes \mathfrak{S}_n} := d_{\theta_1}(\mathcal{X}_\Lambda^Y)$$

are all the irreducible characters of $C_d^n \rtimes \mathfrak{S}_n$ as in Section 2.7.2 (by invoking again [Se, §8.2, Proposition 25]). Therefore, $Y_{d, n}(u)$ is split semisimple and the \mathcal{X}_Λ^Y form the full list of irreducibles.

3. Counting on wild character varieties

3.1. Counting on quasi-Hamiltonian fusion products

Here we describe the technique we use to count the points on wild character varieties, which was already implicitly used in [HV, HLV1]. The idea is to use the construction of the wild character variety as a quotient of a fusion product and reduce the point-counting problem to one on each of the factors. Then the counting function on the entire variety will be the convolution product of those on each of the factors. This can be handled by a type of Fourier transform as in the references above.

3.1.1. Arithmetic harmonic analysis. In carrying out our computations, we will employ the technique of “arithmetic harmonic analysis,” which is an analogue of the Fourier transform for non-abelian finite groups such as $\text{GL}_n(\mathbb{F}_q)$. This is described in [HLV1, §3], a part of which we reproduce here for the convenience of the reader.

Let G be a finite group, $\text{Irr } G$ the set of irreducible characters of G , $C(G_\bullet)$ the vector space of class functions (i.e., functions which are constant on conjugacy classes) on G , and $C(G^\bullet)$ the space of functions on the set $\text{Irr } G$. We define isomorphisms

$$\mathcal{F}_\bullet : C(G_\bullet) \rightarrow C(G^\bullet), \quad \mathcal{F}^\bullet : C(G^\bullet) \rightarrow C(G_\bullet)$$

by

$$\mathcal{F}_\bullet(f)(\chi) := \sum_{x \in G} f(x) \frac{\chi(x)}{\chi(e)}, \quad \mathcal{F}^\bullet(F)(x) := \sum_{\chi \in \text{Irr } G} F(\chi) \chi(e) \bar{\chi}(x).$$

Note that these are not quite mutually inverse, but will be up to a scalar; precisely,

$$\mathcal{F}^\bullet \circ \mathcal{F}_\bullet = |G| \cdot 1_{C(G_\bullet)}, \quad \mathcal{F}_\bullet \circ \mathcal{F}^\bullet = |G| \cdot 1_{C(G^\bullet)}.$$

It is clear that $C(G_\bullet)$ is a subspace of the group algebra $\mathbb{C}[G]$; it is not difficult to verify that it is in fact a subalgebra for the convolution product $*_G$. We can define a product on $C(G^\bullet)$ simply by pointwise multiplication:

$$(F_1 \cdot F_2)(\chi) := F_1(\chi) F_2(\chi).$$

Then \mathcal{F}_\bullet and \mathcal{F}^\bullet have the important properties that

$$\mathcal{F}_\bullet(f_1 *_G f_2) = \mathcal{F}_\bullet(f_1) \cdot \mathcal{F}_\bullet(f_2), \quad |G| \cdot \mathcal{F}^\bullet(F_1 \cdot F_2) = \mathcal{F}^\bullet(F_1) *_G \mathcal{F}^\bullet(F_2) \quad (3.1.1)$$

for $f_1, f_2 \in C(G_\bullet)$ and $F_1, F_2 \in C(G^\bullet)$.

3.1.2. Set-theoretic fusion. Let G be a finite group, M a (left) G -set and $\mu : M \rightarrow G$ an equivariant map of sets (where G acts on itself by conjugation). We may define a function $N : G \rightarrow \mathbb{Z}_{\geq 0}$ by

$$N(x) := |\mu^{-1}(x)|.$$

The equivariance condition implies that $m \mapsto a \cdot m$ gives a bijection $\mu^{-1}(x) \leftrightarrow \mu^{-1}(axa^{-1})$ for $a, x \in G$, and hence it is easy to see that $N \in C(G_\bullet)$.

Suppose M_1 and M_2 are two G -sets and $\mu_1 : M_1 \rightarrow G$ and $\mu_2 : M_2 \rightarrow G$ are equivariant maps, and let $M := M_1 \times M_2$ and define $\mu : M \rightarrow G$ by

$$\mu(m_1, m_2) = \mu_1(m_1) \mu_2(m_2).$$

Then since for $x \in G$,

$$\mu^{-1}(x) = \coprod_{a \in G} \mu_1^{-1}(a) \times \mu_2^{-1}(a^{-1}x),$$

a straightforward computation gives

$$N_M = N_{M_1} *_G N_{M_2}. \quad (3.1.2)$$

3.2. Counting via Hecke algebras

Recall the notation of Section 2.1. Let $V \subseteq G$ be a set of double H -coset representatives as in (2.1.6). Let $k \in \mathbb{Z}_{>0}$, $x \in G$ and

$$\mathbf{v} = (v_1, w_1, \dots, v_k, w_k) \in V^{2k}.$$

For $h \in H$ we set

$$\mathcal{N}_h(x, \mathbf{v}) := \{(a, a_1, \dots, a_k) \in G \times v_1 H w_1 H \times \dots \times v_k H w_k H : axa^{-1} = ha_1 \dots a_k\}.$$

Often we will abbreviate $\mathcal{N}(x, \mathbf{v}) := \mathcal{N}_1(x, \mathbf{v})$. We are interested in the function

$$N : G \times V^{2k} \rightarrow \mathbb{Z}_{\geq 0}, \quad (x, \mathbf{v}) \mapsto |\mathcal{N}(x, \mathbf{v})|. \tag{3.2.1}$$

Proposition 3.2.2. *One has*

$$N(x, \mathbf{v}) = \frac{|H|^{2k}}{|Hv_1H| \dots |Hv_kH|} \operatorname{tr}(xT_{v_1} * T_{w_1} * \dots * T_{v_k} * T_{w_k}).$$

Proof. For $h \in H$, we have bijections

$$\mathcal{N}(x, \mathbf{v}) \leftrightarrow \mathcal{N}_h(x, \mathbf{v}), \quad (a, a_1, \dots, a_{k-1}, a_k) \leftrightarrow (ha, a_1, \dots, a_{k-1}, a_k h^{-1})$$

and hence $|\mathcal{N}(x, \mathbf{v})| = |\mathcal{N}_h(x, \mathbf{v})|$. From this, we get

$$N(x, \mathbf{v}) = \frac{1}{|H|} \sum_{h \in H} |\mathcal{N}_h(x, \mathbf{v})|.$$

On the other hand,

$$\begin{aligned} & \sum_{a \in G} (\mathbb{I}_H * \mathbb{I}_G \mathbb{I}_{v_1 H w_1 H} * \mathbb{I}_G \dots * \mathbb{I}_G \mathbb{I}_{v_k H w_k H})(axa^{-1}) \\ &= \sum_{a \in G} \sum_{h \in G} \mathbb{I}_H(h) (\mathbb{I}_{v_1 H w_1 H} * \mathbb{I}_G \dots * \mathbb{I}_G \mathbb{I}_{v_k H w_k H})(h^{-1}axa^{-1}) \\ &= \sum_{h \in H} \sum_{a \in G} (\mathbb{I}_{v_1 H w_1 H} * \mathbb{I}_G \dots * \mathbb{I}_G \mathbb{I}_{v_k H w_k H})(h^{-1}axa^{-1}) = \sum_{h \in H} |\mathcal{N}_h(x, \mathbf{v})|. \end{aligned}$$

Hence

$$N(x, \mathbf{v}) = \frac{1}{|H|} \sum_{a \in G} (\mathbb{I}_H * \mathbb{I}_G \mathbb{I}_{v_1 H w_1 H} * \mathbb{I}_G \dots * \mathbb{I}_G \mathbb{I}_{v_k H w_k H})(axa^{-1}). \tag{3.2.3}$$

Therefore, if we set

$$\varphi_{\mathbf{v}} := \mathbb{I}_H * \mathbb{I}_G \mathbb{I}_{v_1 H w_1 H} * \mathbb{I}_G \dots * \mathbb{I}_G \mathbb{I}_{v_k H w_k H}$$

then Lemma 2.6.5 applied to (3.2.3) gives us

$$N(x, \mathbf{v}) = \operatorname{tr}(x\varphi_{\mathbf{v}}). \tag{3.2.4}$$

To compute φ_v in $\mathcal{H}(G, H)$ we need

Lemma 3.2.5. *For $v, v_1, w_1 \in V$, one has*

- (a) $|H \cap v^{-1}Hv| = \frac{|H|^2}{|HvH|}$;
- (b) $\mathbb{I}_H *_{G} \mathbb{I}_{vH} = \frac{|H|^2}{|HvH|} \mathbb{I}_{HvH} = \mathbb{I}_{Hv} *_{G} \mathbb{I}_H$;
- (c) $\mathbb{I}_H *_{G} \mathbb{I}_{v_1Hw_1H} = \mathbb{I}_{Hv_1} *_{G} \mathbb{I}_{Hw_1H}$;
- (d) $\mathbb{I}_{v_1Hw_1H} *_{G} \mathbb{I}_H = |H| \mathbb{I}_{v_1Hw_1H}$.

Proof. One finds in [1, §1] a bijection $(H \cap v^{-1}Hv) \setminus H \leftrightarrow H \setminus HvH$ given by

$$(H \cap v^{-1}Hv)h \mapsto Hvh.$$

This quickly yields (a).

Now we let $x \in G$ and evaluate

$$(\mathbb{I}_H *_{G} \mathbb{I}_{vH})(x) = \sum_{h \in G} \mathbb{I}_H(h) \mathbb{I}_{vH}(h^{-1}x) = \sum_{h \in H} \mathbb{I}_{vH}(h^{-1}x).$$

If $x \notin HvH$, then $h^{-1}x \notin vH$ for any $h \in H$, and so the above is zero. On the other hand, if $x = h_0vh$ for some $h_0 \in H$ and $h \in H$, then the above evaluates to

$$|\{h \in H : h^{-1}h_0vh \in vH\}| = |\{h \in H : v^{-1}hv \in H\}| = |H \cap v^{-1}Hv| = \frac{|H|^2}{|HvH|},$$

with the use of (a) for the last step. The second equality in (b) is proved similarly.

For (c), we have

$$\begin{aligned} (\mathbb{I}_{Hv_1} *_{G} \mathbb{I}_{Hw_1H})(x) &= \sum_{a \in G} \mathbb{I}_{Hv_1}(a) \mathbb{I}_{Hw_1H}(a^{-1}x) = \sum_{a \in H} \mathbb{I}_{Hv_1}(hv_1) \mathbb{I}_{Hw_1H}(v_1^{-1}h^{-1}x) \\ &= \sum_{h \in H} \mathbb{I}_H(h) \mathbb{I}_{v_1Hw_1H}(h^{-1}x) = (\mathbb{I}_H *_{G} \mathbb{I}_{v_1Hw_1H})(x). \end{aligned}$$

Finally, for (d) we compute

$$\begin{aligned} (\mathbb{I}_{v_1Hw_1H} *_{G} \mathbb{I}_H)(x) &= \sum_{a \in G} \mathbb{I}_{v_1Hw_1H}(xa^{-1}) \mathbb{I}_H(a) = \sum_{h \in H} \mathbb{I}_{v_1Hw_1H}(xh^{-1}) \\ &= \sum_{h \in H} \mathbb{I}_{v_1Hw_1H}(x) = |H| \mathbb{I}_{v_1Hw_1H}. \quad \square \end{aligned}$$

We can conclude the proof of Proposition 3.2.2 by noting that

$$\begin{aligned} \mathbb{I}_H *_{G} \mathbb{I}_{v_1Hw_1H} &= \mathbb{I}_{Hv_1} *_{G} \mathbb{I}_{Hw_1H} = \frac{|Hw_1H|}{|H|^2} \mathbb{I}_{Hv_1} *_{G} \mathbb{I}_H *_{G} \mathbb{I}_{w_1H} \\ &= \frac{|Hw_1H|}{|H|^3} \mathbb{I}_{Hv_1} *_{G} \mathbb{I}_H *_{G} \mathbb{I}_H *_{G} \mathbb{I}_{w_1H} = \frac{|H|}{|Hv_1H|} \mathbb{I}_{Hv_1H} *_{G} \mathbb{I}_{Hw_1H} \\ &= \frac{|H|^2}{|Hv_1H|} T_{v_1} * T_{w_1}, \end{aligned} \tag{3.2.6}$$

using $\mathbb{I}_H = \frac{\mathbb{I}_{H * G \mathbb{I}_H}}{|H|^k}$, (2.1.9) and the relation between the two different products $*_G$ and $*$ explained in Remark 2.1.8. Thus, by Lemma 3.2.5(d) and (3.2.6),

$$\begin{aligned} \varphi_{\mathbf{v}} &= \frac{1}{|H|^k} \mathbb{I}_H *_G \mathbb{I}_{v_1 H w_1 H} *_G \mathbb{I}_H *_G \mathbb{I}_{v_2 H w_2 H} *_G \cdots *_G \mathbb{I}_H *_G \mathbb{I}_{v_k H w_k H} \\ &= \frac{|H|^{2k}}{|H v_1 H| \cdots |H v_k H|} T_{v_1} * T_{w_1} * \cdots * T_{v_k} * T_{w_k}. \end{aligned}$$

This and (3.2.4) imply Proposition 3.2.2. □

Remark 3.2.7. When $k = 1$ and $v_1 = 1$, Proposition 3.2.2 gives a character formula for the cardinality of the intersection of conjugacy classes and Bruhat strata and appears in [L, 1.3.(a)]. In fact, the computation there is what led us to Proposition 3.2.2.

3.3. Character values at the longest element

From now on we will let G, T, B, U and N be as in Section 2.3. We need to compute certain values of the characters of $\mathcal{H}(G, U)$.

Remark 3.3.1. Let (V, π) be a representation of $Y_{d,n}(u)$, and fix $i \in [1, n - 1]$. The element e_i is the idempotent projector to the subspace V_i of V where $h_i h_{i+1}^{-1}$ acts trivially and there is a direct sum decomposition $V = V_i \oplus W_i$, where $W_i := \ker e_i$. Lemma 2.4.7 shows that this decomposition is preserved by T_i . Over V_i , the endomorphism T_i satisfies the quadratic relation

$$T_i|_{V_i}^2 = u \cdot 1 + (u - 1)T_i|_{V_i}, \tag{3.3.2}$$

whereas over W_i it satisfies

$$T_i|_{W_i}^4 = u^2 \cdot 1. \tag{3.3.3}$$

Theorem 3.3.4. For $\mathcal{X} \in \text{Irr } Y_{d,n}(u)$ the element T_0^2 acts by scalar multiplication by

$$z_{\mathcal{X}} = u^{f_{\mathcal{X}}} \tag{3.3.5}$$

where $f_{\mathcal{X}} := \binom{n}{2} (1 + \frac{\chi_1(\omega)}{\chi_1(1)})$ and $\omega \in N$ is any of the ω_i from Theorem 2.4.3 (all such are conjugate). In particular, on specializing to $u = q$, the central element $T_{\omega_0}^2 \in \mathcal{H}(G, U)$ acts by the scalar $q^{f_{\mathcal{X}}}$.

Proof. Let (V, π) be an irreducible representation affording \mathcal{X} . In the notation of Remark 3.3.1, (3.3.2) shows that the possible eigenvalues of $T_i|_{V_i}$ are u and -1 , and (3.3.3) shows that those of $T_i|_{W_i}$ are $\pm\sqrt{u}, \pm i\sqrt{u}$. Thus,

$$\mathcal{X}(T_i) = m_1^+ \sqrt{u} - m_1^- \sqrt{u} + m_1^{\oplus} i \sqrt{u} - m_1^{\ominus} i \sqrt{u} - m_0 + m_2 u$$

where $m_1^+, m_1^-, m_1^{\oplus}, m_1^{\ominus}, m_0$ and m_2 are the respective multiplicities of $\sqrt{u}, -\sqrt{u}, i\sqrt{u}, -i\sqrt{u}, -1$ and u as eigenvalues of T_i .

Since $\mathcal{X}(T_i) \in \mathbb{C}[u^{\pm 1}]$, we know $m_1^+ = m_1^- =: m_1$ and $m_1^\oplus = m_1^\ominus =: m_1^\circ$, and so

$$\mathcal{X}(T_i) = -m_0 + m_2u, \tag{3.3.6}$$

$$\dim V = \mathcal{X}(1) = 2m_1 + 2m_1^\circ + m_0 + m_2, \tag{3.3.7}$$

$$\begin{aligned} \det \pi(T_i) &= (-1)^{m_0} (\sqrt{u})^{m_1} (-\sqrt{u})^{m_1} (i\sqrt{u})^{m_1^\circ} (-i\sqrt{u})^{m_1^\circ} u^{m_2} \\ &= (-1)^{m_0+m_1} u^{m_1+m_1^\circ+m_2}. \end{aligned} \tag{3.3.8}$$

Since T_0^2 is central, Schur’s lemma implies that it acts by scalar multiplication by some $z_{\mathcal{X}} \in \mathbb{C}[u^{\pm 1}]$. Let $i_1, \dots, i_{\binom{n}{2}}$ be as in (2.4.4). Taking determinants we find

$$z_{\mathcal{X}}^{\dim V} = \det \pi(T_0^2) = \det(\pi(T_{i_1} \cdots T_{i_{\binom{n}{2}}}))^2 = \det \pi(T_i)^{n(n-1)} \tag{3.3.9}$$

for any $1 \leq i \leq n - 1$ since the T_i are all conjugate (Lemma 2.4.8).

Now, under the specialization $u = 1$, T_i maps to ω_i and so (3.3.6) gives

$$\mathcal{X}_1(\omega_i) = -m_0 + m_2. \tag{3.3.10}$$

Substituting (3.3.8) into (3.3.9) gives

$$z_{\mathcal{X}}^{\dim V} = u^{\binom{n}{2}(2m_1+2m_1^\circ+2m_2)} = u^{\binom{n}{2}(2m_1+2m_1^\circ+m_0+m_2-m_0+m_2)} = u^{\binom{n}{2}(\mathcal{X}(1)+\mathcal{X}_1(\omega_i))},$$

where we use (3.3.7) and (3.3.10) for the last equality. Taking $\mathcal{X}(1)$ th roots, we find

$$z_{\mathcal{X}} = \zeta u^{f_{\mathcal{X}}}$$

where ζ is some root of unity and $f_{\mathcal{X}}$ is as in the statement (recall that $\mathcal{X}_1(1) = \mathcal{X}(1)$).

It remains to show that $\zeta = 1$. We do this by specializing $u = 1$. We note that in this specialization $\theta_1(T_0^2) = \sigma_0^2 = 1 \in \mathbb{C}[\mathbb{N}]$. Then

$$\zeta \mathcal{X}(1) = \theta_1(\mathcal{X}(T_0^2)) = \mathcal{X}_1(\theta_1(T_0^2)) = \mathcal{X}_1(1)$$

by (2.9.3), and thus $\zeta = 1$. □

Remark 3.3.11. For $\mathcal{X} = \mathcal{X}_\Lambda$, $\Lambda \in \mathcal{Q}_n$, by Remark 2.9.16 and Theorem 2.9.5 we have

$$f_\Lambda := f_{\mathcal{X}} = \binom{n}{2} \left(1 + \frac{\mathcal{X}_1(\omega)}{\mathcal{X}(1)} \right) = \binom{n}{2} \left(1 + \frac{\chi_\Lambda^{\mathbb{N}}(\omega)}{\chi_\Lambda^{\mathbb{N}}(1)} \right) = \binom{n}{2} \left(1 + \frac{\chi_\Lambda^{\mathbb{N}}(s)}{\chi_\Lambda^{\mathbb{N}}(1)} \right) \tag{3.3.12}$$

with $s \in \mathbb{N}$ any transposition.

Remark 3.3.13. With the modern definition of $Y_{d,n}$ (as in Remark 2.3.3) one can also define the element $T_{s_0} := T_{s_{i_1}} \cdots T_{s_{i_{\binom{n}{2}}}}$ for any factorization $w_0 = s_{i_1} \cdots s_{i_{\binom{n}{2}}}$ of the longest element of \mathfrak{S}_n , as in (2.4.4). By the argument in Lemma 2.4.6 we see that $T_{s_0}^2$ is also central. For a $\Lambda \in \mathcal{Q}_{d,n}$ (as in Remark 2.9.26) and its associated irreducible representation of $Y_{d,n}(u)$, the same argument as for Theorem 3.3.4 proves that $T_{s_0}^2$ acts by scalar multiplication by u^{f_Λ} (as in (3.3.12)).

Therefore, this $T_{s_0}^2$ corresponds to our T_0^2 .

Lemma 3.3.14. *Let $\Lambda \in \mathcal{Q}_n$ and $f_\Lambda = f_{\chi_\Lambda}$ be as in (3.3.12). Then*

$$f_\Lambda = \binom{n}{2} + n(\Lambda') - n(\Lambda), \tag{3.3.15}$$

with the notation of (2.7.4) from Section 2.7.1.

Proof. If $\lambda \in \mathcal{P}_n$ and $\chi_\lambda^\mathfrak{S} \in \text{Irr } \mathfrak{S}_n$ is the corresponding irreducible character of \mathfrak{S}_n and $s \in \mathfrak{S}_n$ is a simple transposition then by [FH, Exercise 4.17(c)] or [F, §7 (16.)],

$$\chi_\lambda^\mathfrak{S}(s) = \frac{2\chi_\lambda^\mathfrak{S}(1)}{n(n-1)} \sum_{i=1}^r \left(\binom{b_i+1}{2} - \binom{a_i+1}{2} \right) \tag{3.3.16}$$

where the a_i and b_i are the number of boxes below and to the right of the i th box of the diagonal in the Young diagram of λ . By writing $j - i$ in the box (i, j) and computing the sum in two ways we see at once that

$$\sum_{i=1}^r \left(\binom{b_i+1}{2} - \binom{a_i+1}{2} \right) = n(\lambda') - n(\lambda). \tag{3.3.17}$$

From this and (3.3.16), we get

$$\binom{n}{2} \left(1 + \frac{\chi_\lambda^\mathfrak{S}(s)}{\chi_\lambda^\mathfrak{S}(1)} \right) = \binom{n}{2} + n(\lambda') - n(\lambda).$$

It remains to prove the analogous formula for $\chi_\Lambda^N \in \text{Irr } N$ with $\Lambda \in \mathcal{Q}_n$.

Since we are working in N , we will omit the superscript and simply write χ_Λ . The description of the character χ_Λ was given in Section 2.7.2 and in particular by the induction formula (2.7.8). We will use the notation established there. We will make the further abbreviations $N(\psi) := T \times \mathbf{Stab } \psi = \prod_i N_i$ and

$$\begin{aligned} \chi_\Lambda^{N(\psi)} &:= \bigotimes_i \chi_{\lambda_i, \psi_i}^{N_i} \in \text{Irr } N(\psi), \\ \chi_\Lambda^\psi &:= \chi_{\lambda_1}^\mathfrak{S} \otimes \cdots \otimes \chi_{\lambda_r}^\mathfrak{S} \in \text{Irr}(\mathbf{Stab } \psi) = \text{Irr}(\mathfrak{S}_{n_1} \times \cdots \times \mathfrak{S}_{n_r}). \end{aligned}$$

In this notation, $\chi_\Lambda = \text{Ind}_{N(\psi)}^N \chi_\Lambda^{N(\psi)}$.

Let us evaluate χ_Λ at any transposition $\sigma \in \mathfrak{S}_n \leq T \times \mathfrak{S}_n = N$. Since

$$\chi_\Lambda^{N(\psi)}(1) = \chi_\Lambda^\psi(1) \quad \text{and} \quad [N : T \times \mathbf{Stab } \psi] = [\mathfrak{S}_n : \mathbf{Stab } \psi]$$

we have

$$\chi_\Lambda(1) = \chi_\Lambda^\psi(1)[\mathfrak{S}_n : \mathbf{Stab } \psi]. \tag{3.3.18}$$

Throughout the remainder of the proof, we will write $g = \xi\pi \in T \times \mathfrak{S}_n = N$ for a general element of N . By (2.7.8) we have

$$\chi_\Lambda(\sigma) = \frac{1}{|T \times \mathbf{Stab } \psi|} \sum_{g \in T \times \mathbf{Stab } \psi} \chi_\Lambda^{N(\psi)}(g\sigma) \tag{3.3.19}$$

where $\chi_\Lambda^{N(\psi)}$ is extended by 0 outside of $T \times \mathbf{Stab} \psi$, and

$${}^g\sigma = g\sigma g^{-1} = \xi({}^\pi\sigma)\xi^{-1} = \xi \cdot ({}^\pi\sigma)(\xi^{-1}) \cdot ({}^\pi\sigma).$$

Note that ${}^\pi\sigma \in \mathfrak{S}_n$ and hence $({}^\pi\sigma)(\xi^{-1}) \in T$. When $({}^\pi\sigma) \in \mathbf{Stab} \psi$ we have

$$\psi(\xi \cdot ({}^\pi\sigma)(\xi^{-1})) = \psi(\xi)\psi({}^\pi\sigma(\xi^{-1})) = \psi(\xi)\psi({}^\pi\sigma)(\xi^{-1}) = \psi(\xi)\psi(\xi^{-1}) = 1.$$

Then

$$\chi_\Lambda^{N(\psi)} = \begin{cases} \chi_\Lambda^\psi({}^\pi\sigma) & \text{if } {}^\pi\sigma \in \mathbf{Stab} \psi, \\ 0 & \text{otherwise,} \end{cases}$$

and (3.3.19) becomes

$$\chi_\Lambda(\sigma) = \frac{1}{|\mathbf{Stab} \psi|} \sum_{\pi \in \mathbf{Stab} \psi} \chi_\Lambda^\psi({}^\pi\sigma) = \text{Ind}_{\mathbf{Stab} \psi}^{\mathfrak{S}_n}(\chi_\Lambda^\psi)(\sigma).$$

Since σ is a transposition, the latter can be computed as

$$\chi_\Lambda(\sigma) = \frac{1}{|\mathbf{Stab} \psi|} \sum_{j=1}^4 \left(\chi_{\lambda_j}^{\mathfrak{S}}({}^\pi\sigma) \prod_{i \neq j} \chi_{\lambda_i}^{\mathfrak{S}}(1) \right) |\{\pi \in \mathfrak{S}_n : \pi\sigma \text{ is in the } j\text{th factor}\}|. \tag{3.3.20}$$

The quantity in the summation is the order of the stabilizer of the set of transpositions s in the j th factor of $\mathbf{Stab} \psi = \mathfrak{S}_{n_1} \times \dots \times \mathfrak{S}_{n_r}$, acted upon by \mathfrak{S}_n . It is thus equal to

$$\binom{n_j}{2} 2(n-2)! = \binom{n_j}{2} \binom{n}{2}^{-1} n!,$$

and (3.3.20) becomes

$$\binom{n}{2} \frac{\chi_\Lambda(\sigma)}{\chi_\Lambda^\psi(1)} = \frac{|\mathfrak{S}_n|}{|\mathbf{Stab} \psi|} \sum_{j=1}^k \binom{n_j}{2} \frac{\chi_{\lambda_j}^{\mathfrak{S}}(s_j)}{\chi_{\lambda_j}^{\mathfrak{S}}(1)}$$

where $s_j \in \mathfrak{S}_{n_j}$ is any transposition. By (3.3.18) this becomes

$$\binom{n}{2} \frac{\chi_\Lambda(\sigma)}{\chi_\Lambda(1)} = \sum_{j=1}^k \binom{n_j}{2} \frac{\chi_{\lambda_j}^{\mathfrak{S}}(s_j)}{\chi_{\lambda_j}^{\mathfrak{S}}(1)},$$

and finally by (3.3.16) and (3.3.17) this becomes

$$\binom{n}{2} \frac{\chi_\Lambda(\sigma)}{\chi_\Lambda(1)} = \sum_{j=1}^k n(\lambda'_j) - n(\lambda_j) = n(\Lambda') - n(\Lambda),$$

from which (3.3.15) follows. □

3.4. Counting at higher order poles

For $r \in \mathbb{Z}_{>0}$, $v \in \mathbf{T}$ and $g \in \mathbf{G}$ let us now define

$$N_v^r(g) := \left| \left\{ (a, S_1, S_2, \dots, S_{2r-1}, S_{2r}) \in \mathbf{G} \times (\mathbf{U}_+ \times \mathbf{U}_-)^r : \right. \right. \\ \left. \left. aga^{-1} = v \prod_{i=1}^r (S_{2(r+1-i)} S_{2(r-i)+1}) \right\} \right|$$

where $\mathbf{U}_+ := \mathbf{U}$ and $\mathbf{U}_- := \mathbf{U}_-(\mathbb{F}_q)$, \mathbf{U}_- being the unipotent radical of \mathbf{B}_- , the Borel opposite to \mathbf{B} .

Theorem 3.4.1. *We have*

$$N_v^r(g) = \sum_{\Lambda \in \mathcal{Q}_n} \chi_\Lambda^{\mathbf{G}}(g) \chi_\Lambda^{\mathcal{H}}(T_v) q^{rf_\Lambda}. \tag{3.4.2}$$

Proof. Recall that the multiplication map $\mathbf{T} \times \mathbf{U}_- \times \mathbf{U}_+ \rightarrow \mathbf{G}$ is an open immersion and that $\mathbf{U}_- = \omega_0 \mathbf{U}_+ \omega_0$, so that every element of $\omega_0 \mathbf{U}_+ \omega_0 \mathbf{U}$ has a unique factorization into a pair from $\mathbf{U}_- \times \mathbf{U}_+$, and similarly for $v\omega_0 \mathbf{U}_+ \omega_0 \mathbf{U}$ and $v\mathbf{U}_- \times \mathbf{U}_+$. Thus, it follows that

$$N_v^r(g) = N(g, \mathbf{v})$$

where $\mathbf{v} = (v_1, w_1, \dots, v_r, w_r)$ with $v_1 = v\omega_0$, $v_i = \omega_0$ for $i > 1$ and $w_i = \omega_0$ for all i . So by Proposition 3.2.2 we have

$$N_v^r(g) = N(g, \mathbf{v}) = \sum_{\Lambda \in \mathcal{Q}_n} \chi_\Lambda^{\mathbf{G}}(g) \chi_\Lambda^{\mathcal{H}}(T_{v\omega_0} * T_{\omega_0} * T_{\omega_0}^{2r-2}) = \sum_{\Lambda \in \mathcal{Q}_n} \chi_\Lambda^{\mathbf{G}}(g) \chi_\Lambda^{\mathcal{H}}(T_v * T_{\omega_0}^{2r}).$$

Theorem 3.3.4 states that $T_{\omega_0}^2$ acts by the scalar q^{f_Λ} in the irreducible representation corresponding to Λ , and the result follows. \square

3.5. Values at generic regular semisimple \mathbb{F}_q -rational elements

Here we compute our count function in the case when $v \in \mathbf{T}^{\text{reg}}$, i.e., when v has distinct eigenvalues.

Proposition 3.5.1. *Let $v \in \mathbf{T}^{\text{reg}}$. Then*

$$N_v^r(g) = \sum_{\Lambda \in \mathcal{Q}_n} \frac{\overline{\chi_\Lambda^{\mathbf{G}}(g)}}{\chi_\Lambda^{\mathbf{G}}(1)} \left(q^{rf_\Lambda} \frac{\chi_\Lambda^{\mathbf{G}}(v)^{|\mathbf{G}|}}{\chi_\Lambda^{\mathbf{G}}(1)} \right) \frac{\chi_\Lambda^{\mathbf{G}}(1)^2}{|\mathbf{G}|} \\ = \sum_{\chi_\Lambda^{\mathbf{G}} \in \text{Irr } \mathbf{G}} \frac{\overline{\chi_\Lambda^{\mathbf{G}}(g)}}{\chi_\Lambda^{\mathbf{G}}(1)} \left(q^{rf_\Lambda} \frac{\chi_\Lambda^{\mathbf{G}}(v)^{|\mathbf{G}|}}{\chi_\Lambda^{\mathbf{G}}(1)} \right) \frac{\chi_\Lambda^{\mathbf{G}}(1)^2}{|\mathbf{G}|} \tag{3.5.2}$$

where the first sum is over the characters $\chi_\Lambda^{\mathbf{G}} \in \text{Irr } \mathbf{G}$ defined in 2.7.1 for functions $\Lambda \in \mathcal{Q}_n$, while the second sum is over all irreducible characters parametrized by $\Lambda : \Gamma \rightarrow \mathcal{P}$ of size n .

Proof. For $v \in T$ and $g \in G$ set

$$N_v^0(g) := |\{(a, u) \in G \times U : aga^{-1} = vu\}|/|U|. \tag{3.5.3}$$

Then as in the proof of Proposition 3.2.2 we compute

$$\begin{aligned} N_v^0(g) &= \frac{1}{|U|^2} \sum_{h \in U} |\{(a, u) \in G \times U : aga^{-1} = huv\}| = \frac{1}{|U|^2} \sum_{a \in G} (\mathbb{I}_U *_{\mathbb{G}} \mathbb{I}_{vU})(aga^{-1}) \\ &= \frac{1}{|U|} \sum_{a \in G} \mathbb{I}_{UvU}(aga^{-1}) = \text{tr}(gT_v) = \sum_{\Lambda \in \mathcal{Q}_n} \chi_{\Lambda}^{\mathcal{H}}(v) \chi_{\Lambda}^G(g), \end{aligned}$$

using $U \cap vUv^{-1} = U$.

As v has different eigenvalues, every matrix in the coset vU is conjugate to v and hence

$$|\{(a, u) \in G \times U : aga^{-1} = vu\}| = |U| |\{a \in G : aga^{-1} = v\}| = |U| |C_G(v)| \tag{3.5.4}$$

if g is conjugate to v and zero otherwise, which yields

$$\sum_{\Lambda \in \mathcal{Q}_n} \chi_{\Lambda}^{\mathcal{H}}(v) \chi_{\Lambda}^G(g) = \sum_{\chi^G \in \text{Irr } G} \overline{\chi^G(v)} \chi^G(g). \tag{3.5.5}$$

Since this is true for every $g \in G$, we conclude

$$\chi^G(v) = \begin{cases} \overline{\chi_{\Lambda}^{\mathcal{H}}(v)} & \text{if } \chi^G = \chi_{\Lambda}^G \text{ for some } \Lambda \in \mathcal{Q}_n, \\ 0 & \text{otherwise.} \end{cases} \tag{3.5.6}$$

Now the first equality in Proposition 3.5.1 follows from Theorem 3.2.2, and the second follows as $\chi_{\Lambda}^G(v) = 0$ unless $\Lambda \in \mathcal{Q}_n$. □

3.6. Counting formulas for wild character varieties

For $i = 1, \dots, k$ let $C_i \subset G$ be a semisimple conjugacy class with eigenvalues in \mathbb{F}_q . As usual, $\mathbb{I}_{C_i} : G \rightarrow \mathbb{C}$ will denote its characteristic function. Fix $g \in \mathbb{Z}_{\geq 0}$ and define $D : G \rightarrow \mathbb{C}$ by $D(g) = |\mu^{-1}(g)|$, where $\mu : G \times G \rightarrow G$ is given by $\mu(g, h) = g^{-1}h^{-1}gh$. Finally, let $m \in \mathbb{Z}_{\geq 0}$, fix $\mathbf{r} = (r_1, \dots, r_m) \in \mathbb{Z}_{>0}^m$, for each $i = 1, \dots, m$ fix $v_i \in T^{\text{reg}}$ and consider the count function $N_{v_i}^{r_i} : G \rightarrow \mathbb{C}$.

With this notation we have

Proposition 3.6.1.

$$\begin{aligned} &D^{*G^g} *_{\mathbb{G}} \mathbb{I}_{C_1} \cdots *_{\mathbb{G}} \mathbb{I}_{C_m} *_{\mathbb{G}} N_{v_1}^{r_1} *_{\mathbb{G}} \cdots *_{\mathbb{G}} N_{v_k}^{r_k}(1) \\ &= \sum_{\chi \in \text{Irr } G} \left(\frac{|G|}{\chi(1)} \right)^{2g} \prod_{j=1}^m \left(\frac{\chi(C_j) |C_j|}{\chi(1)} \right) \prod_{i=1}^k \left(q^{r_i f_{\chi}} \frac{\chi(v_i) |G|}{\chi(1)} \right) \frac{\chi(1)^2}{|G|}. \end{aligned}$$

Proof. Recall that for a conjugacy class C we have the characteristic function

$$1_C(g) = \frac{|C|}{|G|} \sum_{\chi \in \text{Irr } G} \overline{\chi(g)} \chi(C) = \sum_{\chi \in \text{Irr } G} \frac{\overline{\chi(g)}}{\chi(1)} \left(\frac{\chi(C)|C|}{\chi(1)} \right) \frac{\chi(1)^2}{|G|}. \tag{3.6.2}$$

By [HLV1, Lemma 3.1.3] we have

$$D(g) = \sum_{\chi \in \text{Irr } G} \frac{\overline{\chi(g)}}{\chi(1)} \left(\frac{|G|}{\chi(1)} \right)^2 \frac{\chi(1)^2}{|G|}. \tag{3.6.3}$$

Combining Proposition 3.5.1, (3.6.2) and (3.6.3) with the usual arithmetic harmonic analysis of §3.1.1 we get the conclusion. \square

From this we have our final count formula:

Theorem 3.6.4. *With notation as above let (C_1, \dots, C_m) be of type $\mu = (\mu_1, \dots, \mu_m) \in \mathcal{P}_n^m$. Let $(C_1, \dots, C_m, v_1, \dots, v_k)$ be generic and $\tilde{\mu} = (\mu_1, \dots, \mu_m, (1^n), \dots, (1^n))$ be its type. Finally, denote $r = r_1 + \dots + r_k$. Then*

$$\frac{q-1}{|G||T|^k} D^{*Gg} *G \mathbb{I}_{C_1} \cdots *G \mathbb{I}_{C_m} *G N_{v_1}^{r_1} *G \cdots *G N_{v_k}^{r_k}(1) = q^{d_{\tilde{\mu},r}} \mathbb{H}_{\tilde{\mu},r}(q^{1/2}, q^{-1/2}).$$

Here, “generic” is in the sense of Definition 1.2.9, which has an obvious analogue over an arbitrary field.

Proof. Denote $C_{m+i} = C(v_i)$; then $|C(v_i)| = |G|/|T|$ as $v_i \in T^{\text{reg}}$. Furthermore let $r = r_1 + \dots + r_k$. This way we get

$$\begin{aligned} & \frac{q-1}{|G||T|^k} D^{*Gg} *G \mathbb{I}_{C_1} \cdots *G \mathbb{I}_{C_m} *G N_{v_1}^{r_1} *G \cdots *G N_{v_k}^{r_k}(1) \\ &= \frac{q-1}{|G|} \sum_{\chi \in \text{Irr } G} \left(\frac{|G|}{\chi(1)} \right)^{2g} \prod_{j=1}^m \left(\frac{\chi(C_j)|C_j|}{\chi(1)} \right) \prod_{i=1}^k \left(q^{r_i f_\chi} \frac{\chi(v_i)|G|}{\chi(1)|T|} \right) \frac{\chi(1)^2}{|G|} \\ &= \frac{q-1}{|G|} \sum_{\chi \in \text{Irr } G} q^{r f_\chi} \left(\frac{|G|}{\chi(1)} \right)^{2g} \prod_{j=1}^{m+k} \left(\frac{\chi(C_j)|C_j|}{\chi(1)} \right) \frac{\chi(1)^2}{|G|}. \end{aligned} \tag{3.6.5}$$

As $(C_1, \dots, C_m, C_{m+1}, \dots, C_{m+k})$ is assumed to be generic, we can compute exactly as in [HLV1, Theorem 5.2.3]. The only slight difference is the appearance of $q^{r f_\chi}$. We observe that the quantity f_Λ in (3.3.15) behaves well with respect to taking Log, and the same computation as in [HLV1, Theorem 5.2.3] will give Theorem 3.6.4. \square

Remark 3.6.6. In the definition of $\mathbb{H}_{\tilde{\mu},r}(z, w)$ in (0.1.2) we have a sign $(-1)^{r^n}$ on the LHS and $(-1)^r$ on the RHS in (0.1.3). As $\tilde{\mu}$ contains the partition (1^n) , one will not have to compute the plethystic part of the Log function to get $\mathbb{H}_{\tilde{\mu},r}(z, w)$ and in this case the signs on the two sides will cancel. That is why there is no sign in (3.6.5) in front of $q^{r f_\chi}$.

4. Main theorem and conjecture

4.1. Weight polynomial of wild character varieties

Let $\mu \in \mathcal{P}_n^k$ and $\mathbf{r} \in \mathbb{Z}_{>0}^m$. Let $\mathcal{M}_B^{\mu, \mathbf{r}}$ be the generic complex wild character variety defined in (1.2.4). Here we prove our main Theorem 0.2.1.

Proof of Theorem 0.2.1. The strategy of the proof is as follows. First we construct a finitely generated ring R over \mathbb{Z} , which will have the parameters corresponding to the eigenvalues of our matrices. Then we construct a spreading out of $\mathcal{M}_B^{\mu, \mathbf{r}}$ over R . We finish by counting points over \mathbb{F}_q for the spreading out, find that their number is a polynomial in q , and deduce that it is the weight polynomial of $\mathcal{M}_B^{\mu, \mathbf{r}}$ by [HV, Appendix A].

As in [HLV1, Appendix A] first construct the finitely generated ring R of generic eigenvalues of type $\tilde{\mu}$, where

$$\tilde{\mu} = (\mu^1, \dots, \mu^k, (1^n), \dots, (1^n)) \in \mathcal{P}_n^{k+m}.$$

In particular, we have variables $\{a_j^i\} \in R$ for $i = 1, \dots, k + m$ and $j = 1, \dots, l(\mu^i)$ representing the eigenvalues of our matrices. They are already generic in the sense that they satisfy the non-equalities $a_{j_1}^i \neq a_{j_2}^i$ when $0 < j_1 < j_2 \leq l(\mu^i)$ and the ones in (1.2.12).

Generalizing [HLV1, Appendix A] we consider the algebra \mathcal{A}_0 over R of polynomials in $n^2(2g + k + m) + r(n^2 - n)$ variables, corresponding to the entries of $n \times n$ matrices

$$A_1, \dots, A_g; B_1, \dots, B_g; X_1, \dots, X_k, C_1, \dots, C_m$$

and upper triangular matrices S_{2j-1}^i and lower triangular matrices S_{2j}^i with 1 on the main diagonal for $i = 1, \dots, m$ and $j = 1, \dots, r_i$ such that

$$\det A_1, \dots, \det A_g; \quad \det B_1, \dots, \det B_g; \quad \det X_1, \dots, \det X_k$$

are inverted.

Let I_n be the $n \times n$ identity matrix, and let ξ_i be the diagonal matrix with diagonal elements $a_1^{i+k}, \dots, a_n^{i+k}$ for $i = 1, \dots, m$. Finally, for elements A, B of a group, put $(A, B) := ABA^{-1}B^{-1}$. Define $\mathcal{I}_0 \subseteq \mathcal{A}_0$ to be the radical of the ideal generated by the entries of

$$(A_1, B_1) \cdots (A_g, B_g) X_1 \cdots X_k C_1^{-1} \xi_1 S_{2r_1}^1 \cdots S_1^1 C_1 \cdots C_m^{-1} \xi_m S_{2r_m}^m \cdots S_1^m C_m - I_n,$$

$$(X_i - a_1^i I_n) \cdots (X_i - a_{r_i}^i I_n), \quad i = 1, \dots, k,$$

and the coefficients of the polynomial

$$\det(tI_n - X_i) - \prod_{j=1}^{r_i} (t - a_j^i)^{\mu_j^i}$$

in an auxiliary variable t . Finally, let $\mathcal{A} := \mathcal{A}_0/\mathcal{I}_0$ and $\mathcal{U}_{\mu, \mathbf{r}} := \text{Spec}(\mathcal{A})$, an affine R -scheme.

Let $\phi : R \rightarrow \mathbb{K}$ be a map to a field \mathbb{K} and let $\mathcal{U}_{\mu, \mathbf{r}}^\phi$ be the corresponding base change of $\mathcal{U}_{\mu, \mathbf{r}}$ to \mathbb{K} . A \mathbb{K} -point of $\mathcal{U}_{\mu, \mathbf{r}}^\phi$ is a solution in $\mathrm{GL}_n(\mathbb{K})$ to

$$(A_1, B_1) \cdots (A_g, B_g) X_1 \cdots X_k C_1^{-1} \xi_1^\phi S_{2r_1}^1 \cdots S_1^1 C_1 \cdots C_m^{-1} \xi_m^\phi S_{2r_m}^m \cdots S_1^m C_m = I_n \tag{4.1.1}$$

where $X_i \in C_i^\phi$ and C_i^ϕ is the semisimple conjugacy class in $\mathrm{GL}_n(\mathbb{K})$ with eigenvalues

$$\phi(a_1^i), \dots, \phi(a_{r_i}^i)$$

of multiplicities $\mu_1^i, \dots, \mu_{r_i}^i$, and $\xi_i^\phi \in T^{\mathrm{reg}}(\mathbb{K})$ is a diagonal matrix with diagonal entries

$$\phi(a_1^{k+i}), \dots, \phi(a_n^{k+i}).$$

By construction $(C_1^\phi, \dots, C_k^\phi, \xi_1^\phi, \dots, \xi_m^\phi)$ is generic.

Finally, $\mathcal{G} = \mathrm{GL}_n \times T^k$ acts on $\mathcal{U}_{\mu, \mathbf{r}}$ via the formulae (1.2.2). We take

$$\mathcal{M}_{\mu, \mathbf{r}} = \mathrm{Spec}(\mathcal{A}^{\mathcal{G}(R)}),$$

the affine quotient of $\mathcal{U}_{\mu, \mathbf{r}}$ by $\mathcal{G}(R)$. Then for $\phi : R \rightarrow \mathbb{C}$ the complex variety $\mathcal{M}_{\mu, \mathbf{r}}^\phi$ agrees with our $\mathcal{M}_{\mathbf{B}}^{\mu, \mathbf{r}}$ and thus $\mathcal{M}_{\mu, \mathbf{r}}$ is its spreading out.

We need the following

Proposition 4.1.2. *Let $\phi : R \rightarrow \mathbb{K}$ be a homomorphism to a field \mathbb{K} . Then if $A_i, B_i, X_j, C_\alpha \in \mathrm{GL}_n(\mathbb{K})$, and a solution to (4.1.1) representing a \mathbb{K} -point in $\mathcal{U}_{\mu, \mathbf{r}}^\phi$ is stabilized by*

$$(y, x_1, \dots, x_m) \in \mathcal{G}^\phi = \mathcal{G} \otimes_\phi \mathbb{K} = \mathrm{GL}_n(\mathbb{K}) \otimes T(\mathbb{K})^m,$$

then

$$y = x_1 = \dots = x_m \in Z(\mathrm{GL}_n(\mathbb{K}))$$

is a scalar matrix. Equivalently, if $D = \{\lambda I_n, \dots, \lambda I_n\} \leq \mathcal{G}^\phi$ is the corresponding subgroup then $\overline{\mathcal{G}}^\phi := \mathcal{G}^\phi / D$ acts set-theoretically freely on $\mathcal{U}_{\mu, \mathbf{r}}^\phi$.

Proof. By assumption

$$x_\alpha C_\alpha y^{-1} = C_\alpha, \tag{4.1.3}$$

thus the matrices y, x_1, \dots, x_m are all conjugate and split semisimple. Let $\lambda \in \mathbb{K}$ be one of their eigenvalues and $V_\lambda \subset \mathbb{K}^n$ be the λ -eigenspace of y . Then by (4.1.3), $C_\alpha(V_\lambda) \subseteq \mathbb{K}^n$ is the λ -eigenspace of x_α . As y commutes with all of A_i, B_i, X_j , we see that they leave V_λ invariant. While x_α commutes with S_i^α and ξ_α , they leave $C_\alpha(V_\lambda)$ invariant or equivalently $C_\alpha^{-1} S_i^\alpha C_\alpha$ and $C_\alpha^{-1} \xi_\alpha C_\alpha$ leave V_λ invariant. As S_i^α is unipotent,

$$\det(C_\alpha^{-1} S_i^\alpha C_\alpha|_{V_\lambda}) = 1$$

and the determinant of the equation (4.1.1) restricted to V_α gives

$$\prod_{i=1}^k \det(X_i|_{V_\lambda}) \prod_{\alpha=1}^m \det(\xi_\alpha|_{V_\lambda}) = 1.$$

By assumption $(C_1^\phi, \dots, C_k^\phi, \xi_1^\phi, \dots, \xi_m^\phi)$ is generic. Thus, from (1.2.10) we get $V_\lambda = \mathbb{K}^n$. □

Let now $\mathbb{K} = \mathbb{F}_q$ be a finite field and assume we have $\phi : R \rightarrow \mathbb{F}_q$. Because $\bar{\mathcal{G}}$ is connected and $\bar{\mathcal{G}}(\mathbb{K})$ acts freely on $\mathcal{U}_{\mu,r}^\phi$, by similar arguments to those in [HLV1, Theorem 2.1.5], [HV, Corollaries 2.2.7, 2.2.8] and by Theorem 3.6.4 we have

$$\#\mathcal{M}_{\mu,r}^\phi(\mathbb{F}_q) = \frac{\#\mathcal{U}_{\mu,r}^\phi}{\#\bar{\mathcal{G}}(\mathbb{F}_q)} = q^{d_{\mu,r}} \mathbb{H}_{\mu,r}(q^{1/2}, q^{-1/2}).$$

As by construction $\mathbb{H}_{\mu,r}(q^{1/2}, q^{-1/2}) \in \mathbb{Q}(q)$ and $\#\mathcal{M}_{\mu,r}^\phi(\mathbb{F}_q)$ is an integer for all prime powers q , we get $\#\mathcal{M}_{\mu,r}^\phi(\mathbb{F}_q) \in \mathbb{Q}[q]$. Katz’s Theorem 1.1.1 applies, which together with the combinatorial Corollary 4.2.5 finishes the proof. □

We have the following immediate

Corollary 4.1.4. *The weight polynomial of $\mathcal{M}_B^{\mu,r}$ is palindromic:*

$$WH(\mathcal{M}_B^{\mu,r}; q, -1) = q^{d_{\mu,r}} WH(\mathcal{M}_B^{\mu,r}; 1/q, -1).$$

Proof. This is a consequence of Theorem 0.2.1 and the combinatorial Corollary 4.2.5 proved below. □

4.2. Mixed Hodge polynomial of wild character varieties

In this section we discuss Conjecture 0.2.2. First we recall the combinatorics of various symmetric functions from [HLV1, §2.3]. Let

$$\Lambda(\mathbf{x}) := \Lambda(\mathbf{x}_1, \dots, \mathbf{x}_k)$$

be the ring of functions separately symmetric in each of the set of variables

$$\mathbf{x}_i = (x_{i,1}, x_{i,2}, \dots).$$

For a partition $\lambda \in \mathcal{P}_n$, let

$$s_\lambda(\mathbf{x}_i), \quad m_\lambda(\mathbf{x}_i), \quad h_\lambda(\mathbf{x}_i) \in \Lambda(\mathbf{x}_i)$$

be the Schur, monomial and complete symmetric functions, respectively. By declaring $\{s_\lambda(\mathbf{x}_i)\}_{\lambda \in \mathcal{P}}$ to be an orthonormal basis, we get the Hall pairing $\langle \cdot, \cdot \rangle$, with respect to which $\{m_\lambda(\mathbf{x}_i)\}_{\lambda \in \mathcal{P}}$ and $\{h_\lambda(\mathbf{x}_i)\}_{\lambda \in \mathcal{P}}$ are dual bases. We also have the Macdonald polynomials of [GH],

$$\tilde{H}_\lambda(q, t) = \sum_{\mu \in \mathcal{P}_n} \tilde{K}_{\lambda\mu} s_\mu(\mathbf{x}) \in \Lambda(\mathbf{x}) \otimes_{\mathbb{Z}} \mathbb{Q}(\mathbf{q}, \mathbf{t}).$$

Finally, we have the plethystic operators Log and Exp (see e.g. [HLV1, §2.3.3]).

With this we can define for $\mu = (\mu^1, \dots, \mu^k) \in \mathcal{P}_n^k$ and $r \in \mathbb{Z}_{>0}$ the analogue of the Cauchy kernel:

$$\Omega_k^{g,r}(z, w) := \sum_{\lambda \in \mathcal{P}} \mathcal{H}_\lambda^{g,r}(z, w) \prod_{i=1}^k \tilde{H}_\lambda(z^2, w^2; \mathbf{x}_i) \in \Lambda(\mathbf{x}_1, \dots, \mathbf{x}_k) \otimes_{\mathbb{Z}} \mathbb{Q}(z, w),$$

where the hook function $\mathcal{H}_\lambda^{g,r}(z, w)$ was defined in (0.1.3). This way we can define

$$\mathbb{H}_{\mu,r}(z, w) := (-1)^{rn} (z^2 - 1)(1 - w^2) \langle \text{Log}(\Omega_k^{g,r}(z, w)), h_{\mu^1}(\mathbf{x}_1) \otimes \dots \otimes h_{\mu^k}(\mathbf{x}_k) \rangle,$$

which is equivalent to the definition in (0.1.2).

We have an alternative formulation of the polynomials $\mathbb{H}_{\mu,r}(z, w)$ using only the Cauchy functions $\Omega_k^{g,0}$ for $r = 0$, which we learnt from F. R. Villegas.

Lemma 4.2.1. *One has*

$$\mathbb{H}_{\mu,r}(z, w) = (z^2 - 1)(1 - w^2) \langle \text{Log}(\Omega_{k+r}^{g,0}(z, w)), h_\mu(\mathbf{x}) \otimes_{s(1^n)}(\mathbf{x}_{k+1}) \otimes \dots \otimes_{s(1^n)}(\mathbf{x}_{k+r}) \rangle.$$

Proof. Recall [HLV3, Proposition 3.1, Lemma 3.3] that the operation

$$F \mapsto [F] = (-1)^n \langle F, s_{(1^n)}(\mathbf{x}) \rangle$$

for $F \in \Lambda(\mathbf{x}) \otimes_{\mathbb{Z}} \mathbb{Q}(z, w)$ commutes with taking the Log, i.e.

$$[\text{Log}(F)] = \text{Log}([F]). \tag{4.2.2}$$

We also have

$$\langle \tilde{H}_\lambda(q, t; \mathbf{x}_i), s_{(1^n)}(\mathbf{x}_i) \rangle = t^{n(\lambda)} q^{n(\lambda')},$$

which is [GH, I.16]. This implies

$$(-1)^{rn} \langle \Omega_{k+r}^{g,0}(z, w), s_{(1^n)}(\mathbf{x}_{k+1}) \otimes \dots \otimes_{s(1^n)}(\mathbf{x}_{k+r}) \rangle = \Omega_k^{g,r}(z, w).$$

In turn (4.2.2) gives the result. □

We can now recall Conjecture 0.2.2, which predicts the mixed Hodge polynomial

$$WH(\mathcal{M}_B^{\mu,r}; q, t) = (qt^2)^{d_{\mu,r}} \mathbb{H}_{\tilde{\mu},r}(q^{1/2}, -q^{-1/2}t^{-1}), \tag{4.2.3}$$

where again $\tilde{\mu} = (\mu^1, \dots, \mu^k, (1^n), \dots, (1^n)) \in \mathcal{P}_n^{k+m}$ and $r = r_1 + \dots + r_m$. Here we are going to list some evidence for and consequences of this conjecture. The main evidence for Conjecture 0.2.2 is naturally Theorem 0.2.1 showing that the $t = -1$ specialization of (4.2.3) is true.

The first observation is the following

Lemma 4.2.4. $\mathbb{H}_{\mu,r}(z, w) = \mathbb{H}_{\mu,r}(w, z) = \mathbb{H}_{\mu,r}(-w, -z).$

Proof. As the Macdonald polynomials satisfy the symmetry

$$\tilde{H}_{\lambda'}(w^2, z^2; \mathbf{x}) = \tilde{H}_{\lambda}(z^2, w^2; \mathbf{x})$$

with λ' the dual partition, and the hook polynomials satisfy $\mathcal{H}_{\lambda}^{g,r}(z, w) = \mathcal{H}_{\lambda}^{g,r}(w, z) = \mathcal{H}_{\lambda}^{g,r}(-w, -z)$, the result follows. \square

An immediate consequence is

Corollary 4.2.5. $\mathbb{H}_{\mu,r}(q^{1/2}, q^{-1/2}) = \mathbb{H}_{\mu,r}(q^{-1/2}, q^{1/2})$.

Conjecture 0.2.2 and Lemma 4.2.4 imply the following *curious Poincaré duality*:

Conjecture 4.2.6. $WH(\mathcal{M}_{\mathbb{B}}^{\mu,r}; q, t) = (qt)^{d_{\mu,r}} WH(\mathcal{M}_{\mathbb{B}}^{\mu,r}; 1/(qt^2), t)$.

Next we have

Theorem 4.2.7. *Let $g = 0, k = 0, m = 1, r_1 = 1$ and $n \in \mathbb{Z}_{>1}$. Then $\mathcal{M}_{\mathbb{B}}^{\emptyset,(1)} = \emptyset$. Hence, in this case $\mathbb{H}_{(1^n),1}(z, w) = 0$. In other words, in this case Conjecture 0.2.2 holds.*

Proof. As $T \times U^- \times U^+ \rightarrow G$ given by $\xi, S_1, S_2 \mapsto \xi S_1 S_2$ is an embedding, $\xi_1 S_1 S_2 = 1$ implies $\xi_1 = 1 \notin T^{\text{reg}}$, showing that $\mathcal{M}_{\mathbb{B}}^{\emptyset,1} = \emptyset$.

As $s_{(1^n)} = \sum_{\lambda \in \mathcal{P}_n} K_{(1^n)\lambda}^* h_{\lambda}$, by Lemma 4.2.1 we get

$$\begin{aligned} \frac{\mathbb{H}_{(1^n),1}(z, w)}{(z^2 - 1)(1 - w^2)} &= (-1)^n \langle \text{Log}(\Omega_1^{0,1}(z, w)), h_{(1^n)}(\mathbf{x}_1) \rangle \\ &= \langle \text{Log}(\Omega_2^{0,0}(z, w)), h_{(1^n)}(\mathbf{x}_1) \otimes s_{(1^n)}(\mathbf{x}_2) \rangle \\ &= \sum_{\lambda \in \mathcal{P}_n} K_{(1^n)\lambda}^* \langle \text{Log}(\Omega_2^{0,0}(z, w)), h_{(1^n)}(\mathbf{x}_1) \otimes h_{\lambda}(\mathbf{x}_2) \rangle = 0. \end{aligned}$$

The last steps follows from [HLV1, (1.1.4)], the orthogonality property of the usual Cauchy function $\Omega_2^{0,0}$. \square

After the case in Theorem 4.2.7 the next non-trivial case is when $g = 0, k = 1, m = 1, r = 1$ and $\mu = (\mu) \in \mathcal{P}_n$. The corresponding wild character variety $\mathcal{M}_{\mathbb{B}}^{(\mu),(1)}$ is known from [B4, Corollary 9.10] to be isomorphic to a tame character variety $\mathcal{M}_{\mathbb{B}}^{\mu'}$ where

$$\mu' = ((n' - 1, 1), \dots, (n' - 1, 1), \mu') \in \mathcal{P}_{n'}^{n'+1}$$

with $n' = n - \mu_1$ and $\mu' = (\mu_2, \mu_3, \dots) \in \mathcal{P}_{n'}$. Combining Boalch's $\mathcal{M}_{\mathbb{B}}^{(\mu),(1)} \cong \mathcal{M}_{\mathbb{B}}^{\mu'}$ with Conjecture 0.2.2 we get the following combinatorial

Conjecture 4.2.8. *With the notation as above, $\mathbb{H}_{(\mu,(1^n)),1}(z, w) = \mathbb{H}_{\mu'}(z, w)$.*

Remark 4.2.9. In a recent preprint [Me, Corollary 7.2] Anton Mellit gives a combinatorial proof of this conjecture. From our results we see that Theorem 0.2.1 and [B4, Corollary 9.10] imply the $t = -1$ specialization

$$\mathbb{H}_{(\mu,(1^n)),1}(q^{1/2}, q^{-1/2}) = \mathbb{H}_{\mu'}(q^{1/2}, q^{-1/2}).$$

When $n = 2$ we will check Conjecture 4.2.8, as well as our main Conjecture 0.2.2, in some particular cases in the next section.

5. Examples when $n = 2$

In this section we set $n = 2$, $g \in \mathbb{Z}_{\geq 0}$, $k + m > 0$, $\mathbf{r} = (r_1, \dots, r_m) \in \mathbb{Z}_{>0}^m$, $r = r_1 + \dots + r_m$ and $\boldsymbol{\mu} = ((1^2), \dots, (1^2)) \in \mathcal{P}_m$. Conjecture 0.2.2 in this case predicts that the mixed Hodge polynomial $WH(\mathcal{M}_B^{\boldsymbol{\mu}, \mathbf{r}}; q, t)$ is given by

$$\begin{aligned} (qt^2)^{d_{\boldsymbol{\mu}, \mathbf{r}}} \mathbb{H}_{\tilde{\boldsymbol{\mu}}, r}(q^{-1/2}, -(qt^2)^{1/2}) &= \frac{(qt^2 + 1)^{k+m}(q^2t^3 + 1)^{2g}(1 + qt)^{2g}}{(q^2t^2 - 1)(q^2t^4 - 1)} \\ &\quad - \frac{2^{k+m-1}(qt^2)^{2g+r-2+k+m}(qt + 1)^{4g}}{(q - 1)(qt^2 - 1)} \\ &\quad + \frac{t^{-2r}(qt^2)^{2g+2r-2+k+m}(q + 1)^{k+m}(q^2t + 1)^{2g}(1 + qt)^{2g}}{(q^2 - 1)(q^2t^2 - 1)}. \end{aligned} \tag{5.1.1}$$

Note, in particular, that the formula depends only on $k + m$ and r .

By Theorem 0.2.1, substituting $t = -1$ gives

$$\begin{aligned} WH(\mathcal{M}_B^{\boldsymbol{\mu}, \mathbf{r}}; q, -1) &= (q + 1)^{k+m}(q^2 - 1)^{2g-2}(q - 1)^{2g} - 2^{k+m-1}q^{2g+r-2+k+m}(q - 1)^{4g-2} \\ &\quad + q^{2g+2r-2+k+m}(q + 1)^{k+m}(q^2 - 1)^{2g-2}(q - 1)^{2g}. \end{aligned} \tag{5.1.2}$$

Fix now $g = 0$ in the remainder of this section. Then from (1.2.14) we get

$$\dim \mathcal{M}_B^{\boldsymbol{\mu}, \mathbf{r}} = 4(k - 2) - 2k + 2(m + r) + 2 = 2(k + r + m) - 6. \tag{5.1.3}$$

When $k + r + m < 3$, the moduli spaces are empty and the corresponding formula in (5.1.1) gives indeed 0.

When $k + m + r = 3$, we have $k = 0, m = 1$ and $r = 2$, or $k = m = r = 1$, or $k = 3$ and $r = m = 0$. In these cases we get 1 in (5.1.1). This corresponds to the fact that the moduli spaces are then single points, as they are 0-dimensional by (5.1.3) and we have

$$WH(\mathcal{M}_B^{\boldsymbol{\mu}, \mathbf{r}}; q, -1) = 1$$

by (5.1.2). In particular,

$$\mathbb{H}_{((1^2), (1^2)), 1}(z, w) = 1 = \mathbb{H}_{((1^2), (1^2), (1^2))}(z, w),$$

confirming Conjecture 4.2.8 when $n = 2$.

Finally, when $k + m + r = 4$, the moduli spaces are 2-dimensional from (5.1.3). In the tame case when $k = 4$ and $m = 0$ we get the familiar \hat{D}_4 case discussed in [HLV1, Conjecture 1.5.4] with mixed Hodge polynomial

$$WH(\mathcal{M}_B^{((1^2), (1^2), (1^2), (1^2))}; q, t) = 1 + 4qt^2 + q^2t^2.$$

In fact, the corresponding Higgs moduli space $\mathcal{M}_{\text{Dol}}^{((1^2), (1^2), (1^2), (1^2))}$ served as the toy model in [Hau] and has the same perverse Hodge polynomial.

We have four wild cases with $k + m + r = 4$. When $k = 2$ and $m = r = 1$, the formula (5.1.1) predicts

$$WH(\mathcal{M}_B^{((1^2),(1^2)),(1)}; q, t) = 1 + 3qt^2 + q^2t^2. \tag{5.1.4}$$

We can prove this by looking at [VdPS, p. 2636] and read off the wild character variety of type $(0, 0, 1)$ given as an affine cubic surface $f(x_1, x_2, x_3) = 0$ with leading term $x_1x_2x_3$. By computation we find that f has isolated singularities, and the leading term has isolated singularities at infinity. Thus [ST, Theorem 3.1] applies, showing that $\mathcal{M}_B^{((1^2),(1^2)),(1)}$ has the homotopy type of a bouquet of 2-spheres. In particular it is simply connected and there is only one possibility for the weights on $H^2(\mathcal{M}_B^{((1^2),(1^2)),(1)})$ to give the weight polynomial

$$WH(\mathcal{M}_B^{((1^2),(1^2)),(1)}; q, -1) = 1 + 3q + q^2,$$

which we know from (5.1.2), namely the one giving (5.1.4).

When $k = 1, m = 1$ and $r = 2$, the formula (5.1.1) predicts the mixed Hodge polynomial

$$WH(\mathcal{M}_B^{(1^2),(2)}; q, t) = 1 + 2qt^2 + q^2t^2. \tag{5.1.5}$$

This again can be proved by looking at [VdPS, p. 2636, case $(0, -, 2)$]; we get an affine cubic surface with leading term $x_1x_2x_3$. Again [ST, Theorem 3.1] implies that $\mathcal{M}_B^{(1^2),(2)}$ is homotopic to a bouquet of 2-spheres, thus the only possible weight on $H^2(\mathcal{M}_B^{(1^2),(2)})$ to give the known specialization

$$WH(\mathcal{M}_B^{(1^2),(2)}; q, -1) = 1 + 2q + q^2$$

is the one claimed in (5.1.5).

When $k = 0$ and $m = r = 2$, we again get a cubic surface [VdPS, p. 2636, case $(1, -, 1)$] and thus the same

$$WH(\mathcal{M}_B^{\emptyset,(2,2)}; q, t) = 1 + 2qt^2 + q^2t^2,$$

which we can prove exactly as above.

Finally, when $k = 0, m = 1$ and $r = 3$ we get

$$WH(\mathcal{M}_B^{\emptyset,(3)}; q, t) = 1 + qt^2 + q^2t^2.$$

Here the same argument applies using the explicit cubic equation in [VdPS, p. 2636, case $(-, -, 3)$].

Acknowledgments. We thank Philip Boalch, Daniel Bump, Maria Chlouveraki, Alexander Dimca, Mario García-Fernández, Eugene Gorsky, Emmanuel Letellier, András Némethi, Loïc Poulain d’Andecy, Vivek Shende, Szilárd Szabó and Fernando R. Villegas for discussions and/or correspondence and a referee for pointing out some necessary corrections. We are also indebted to Lusztig’s observation [L, 1.3.(a)] which led us to study representations of Yokonuma–Hecke algebras.

This research was supported by École Polytechnique Fédérale de Lausanne, an Advanced Grant “Arithmetic and physics of Higgs moduli spaces” no. 320593 of the European Research Council and the NCCR SwissMAP of the Swiss National Foundation. Additionally, at the final stages of this project, MLW was supported by SFB/TR 45 “Periods, moduli and arithmetic of algebraic varieties”, subproject M08-10 “Moduli of vector bundles on higher-dimensional varieties”.
